 \mathbf{V}

The history of my connection with the Voynich manuscript is as follows: in 1951 Mr. William F. Friedman introduced

me to che manuscript and 1 spent my spare time in studying the combinations of the most com monk occurring symbols 1

wrote a report of my work for Mr. Friedman, I should mention that che only parr of the manuscript which was available to

me at the time was the rwenty pages at the end which contain no illustrations. In fan he deli berate! v used me as a

control — he told me nothing other than the information about the manuscript contained in the book The Cipher of Roger

Bacon by Newbold. On the strength of this study \ came to the rather definite conclusion that the text could not have been

arrived at merely by the substitution of single symbols for lecrers whatever the language involved

Subsequently about twelve yean ago I read a paper to the Bain more Bibliophiles covering the history of the manuscript

and some of the attempts to decipher it. This paper, almost unaltered, was printed in an internal office journal.

In the fall of 1975 I read a paper on the subject to a group of colleagues. As this occasion was rather widely advertised

within the organuation. it attracted quite a large audience and the attention of some of those who attended was draw n to the

study of the manuscript

From the time when Mr. Friedman's health began to fail* 1 have acted as a sort of unofficial coordinator of the work ot

some of the people who have been working on the problem, and when Miss Mary Dlmperio told me of her interest. J

suggested that she should assume this responsibility.

She has written a far more comprehensive and more scholarly survey of the problem rhan mine and ir will. I believe,

become the definitive background of future work in this field.

To mv knowledge rhere have been three rather extensive analyses of the script of che manuscript, by Mr Friedman, bv

me, and by Captain Prescott Currier. Of these, I believe Captain Currier s to be far the most complete. All three have

reached similar conclusions

at any rate in some aspens, and I find myself quite unable to accept any suggested solution unless it takes account of these analyses.

John H. Tiirman 24 November L9^6

Introduction

The reader may well wonder. "Why still another paper on the Voynich manuscript/" So much has been written ahead v

on that most studied, most curious, and most mysterious manuscript upon which so many researchers have exhausted cheir

faculties in vain. Perhaps a few words of explanation might be useful in setting the stage for the reader, and in presenting the

motivation for this monograph.

As a relatively recent newcomer to the ranks of Vovnich manuscript students. 1 have unwittingly retraced the steps of all

my predecessors, rediscovering their sources, repeating their experiments, growing excited over the same promising leads that

excited them, and learning only later that all these things had already been tried and had failed, often several times. I have

no wish to impiv that I regret any of my efforts. In fact, I little suspected, when I was first introduced to the problem of the

Voynich manuscript at Brigadier Tilcmans lecture in November 1975, that I would spend ail mv spare time for the next

vear on an intellectual and spinrual journey spanning so many centuries and ranging over so many aspects of art. hittory.

philosophy, and philology, I have thoroughly enjoyed every moment of mv investigations, and would not give them up atanv price.

The fact remains that, in spite of all the papers that others have written aboui the manuscript, there is. to m v knowledge,

no compete survey of all the approaches, ideas, background information and analytic studies that have accumulated over the

nearly fitfv-five rears since the manuscript was discovered by Wilfrid M Vovnich in 1912. Most of the papers have been

written either to advance or to refute a particular theory, providing in passing a brief glance at others efforts, primarily to

sweep rhem out of the way. Some presentations provide good treatments of some aspects of the problem, nocably those by

Voynich 4 1921), Newbold (1928), Tiltman (19681. and Krischer f 1969K Much vital information, however, is to be found

only in unpublished notes and papers inaccessible to most students. I have felt that it would be useful to pull together all the

information I could obtain from all the sources I have examined, and to present it in an orderly fashion, I hope that the

resulting survey will provide a firm basis upon which ocher students may build their work, whether they seek to decipher the

text or simply to learn more about the problem.

This monograph will be arranged in four mam sections. First I will present a survty of alt the basic facts of the problem:

the givens r . u it were. Second, 1 will try to cover all the pnmarv avenues of attack and the information relevant to each,

the external characteristics of the manuscript itself, the drawings, and the text. Third. I will survey the major claims of

decipherment and other substantial analytic work carried out by various researchers. Fourth. 1 will provide a rapid sketch of

collateral and background topics which seem likely io be useful. An extensive bibliography is included, comprising books and

papers on the Vovnich manuscript itself and on a variety of related topics.

1 wish to express my appreciation for the generous aid of John H. Tillman, without whose encouragement this mono-

graph would never have been completed. I wish also to thank Stuart Buck. Edwm S. Spiegelrhal. and Stuart MacChmock.

who proofread my manuscript and offered many helpful mutisms and suggestions.

ix

Chapter 1
The Known Facts

1 A The Manuscript As Found

It set ms important first of all to distinguish dearly between the givens — the incontrovertible tacts available to -all sty dents

of the manuscript— and the lush growth of conjecture that has accumulated around the few meagre certainties we have. A

dear physical description of the codex itself is provided by several authors. The entry in the catalogue of H. P. Kraus

(antiquarian bookdeaier and owner of the manuscript for a number of vears) provides an excellent* compact sketch (see

figure 1 S. In brief, the mysterious manuscript consists -in a^amaU quarto volume, with leaves of varving size but of an average

nine by six inches, some multiply folded. Most pages contain, in addition to copious text in the unknown script (which I will

call the "Voynich script" throughout this paper), colored pictures of considerable variety, whose meaning is open to

conjecture. Most appear to represent plants, astrological or cosmological material, and pharmaceutical recipes, while j few

show human figures surrounded by bizarre objects in scenes of undetermined import. The text and drawings will be studied

in considerable detail in Chapters 3 and 4.

The manuscript has no cover; the first page contains only four brief paragraphs of text without pictures, but with an

apparent crude attempt at rubrication by means of enlarged and embellished initial characters in red ink. The Last page shows

a few lines of writing near the top. in a different script or mixture of scripts than the bulk of the text, along with a few

symbols from the Voynich script, and a scattering of sketthy drawings of animals, people, and other unidentifiable objects in

the upper left corner. Some leaves in the body of the manuscript also contain jottings (largely illegible) in scripts and hands

apparently differing from the majority of the text. These atypical scraps of writing will be dealt with more fully below

We have one other bit of concrete data to exploit: a letter, found between the pages of the manuscript by Wilfrid

Vovruch. Figure 2 shows this letter, and figure 3 provides its translation from Latin as prepared for Vovnich and published

by him (1921, p. 27). The letter was written by Joannas Marcus Marci in Prague to accompany his gift of the manuscript in

Athanasius Kircher, S. J., in Rome. The letter adds the following solid facts to our knowledge t'as fleshed out by the research

of Vovruch, which he describes in interesting detail in the work cited above):

The manuscript was in the hands of Joann us Marcus Marci (A.D 1 595-1667 L official physician to Emperor Rudolph II

of Bohemia (A. D. 1352-1612). in the year 1665 or 1666.

It had previously been in the possession of one or more other persons, otherwise unidentified, probably associated with the court of Rudolph II.

It passed from the possession of Marci to Athanasius Kircher in 1665 or 1666. and remained m his hands for an unknown period of time.

It had been sold to Rudolph by an unidentified person at in unstated time for the large sum of 600 ducats, according to

information provided to Marci by a Dr. Raphael Missowsky (A.D. 1580-1644), who was a familiar at the courts of

Rudolph and his successors.

Another nugget of information was wrested from the enigmatic pages of the manuscript itself as a result of a fortunate

accident. A mishap during photographic reproduction of the manuscript revealed a partially erased signature on the first

page. Examined under infra -red light* this signature was found to be "Jacobi 1 Tepenece", that of a man identified by

Voynich as jacobus Hordckv de Tepenecz (d. 1622), This man was director of Rudolph s botanical gardens and alchemical

laboratory' He did not acquire the patent of nobility with the title "de Tepenecz until after 1608, Thus, we have one

additional fact: the manuscript was in the hands of another familiar at Rudolph's court at some time during the period from

1608 to 1622.

The last bit of concrete evidence we have is the place where the manuscript was found by Voynich in 1912. this source

was kept secret for some years, in the expectation chat Vovnich might wish to return and purchase more manuscripts there It

was ultimate! v revealed to be the Villa Mondragonc, in Italy not far from Rome. The following is a precis of information

concerning Mondragone. gathered by John Tiltman:

■A villa in Fraurau near Rome, buih by Cardinal Aliemps jboui 1570, In I Pope Oregon Kill nued from Mtmdrairune the

bulJ reforming the calendar. The villa apparently continued in the AUempi tamih. at in U>2() j Urer member Deque jtned the Mimdratfime

library to the Vatican Ltbrarv In 1B65 rhe vilL became a Jcimi College which iinally Josed in 1 Tdcmjr l^od, p 2

1

This. then, is all we realfy know for certain about the enigmatic codex: what observant students have seen in the book

itself, acid the letter that accompanied it when found. (So far as I can discover, no scientific study of any kind has ever been

carried out on the inks, pigments, or parchment; and no attempt has been made to examine rhe pages under special light for

hidden writing.) Upon this meagre foundation of fact, an imposing edifice of deduction and guesswork has been erected

through creative research and persistent scholarship, first by Wilfrid Voynich, and then by a succession of larer students.

Later sections of this paper will deal in fuller detail with that conjectures, many of which seem well founded and of certain

value ro future students of the manuscript.

L2 The Knoum History of the Manuscript

A set of solid bench marks can be assembled from the sources described above, and summarized as follows:

The manuscript was in the hands of some unknown person who brought ir ro Rudolph's court some time before 1608.

It was in the possession of Jacobus de Tepenecz for some time after 1608 and before his death in 1622.

It was held for some time by another person, unidentified, who willed it to Joannus Marcus Marci sometime before 1665 or 1666.

ft was sent by Mara from Prague, during 1665 or 1 666. ro his old teacher. Athanasius Kirrher. in Rome.

It did not tfr n reenter recorded

history until it was discovered by Wilfrid Voynich at the Villa Mondrasrone. Frascati, lealy in 1912.

After the death of Vovtuch m 1930. the manuscript remained in the estate of his widow (author of a well-known novel.

Tbt Gadfly, which enjoyed great popularity in the Soviet Union). Mrs. Vovnich died in July I960. Miss A M Nill. a dose

friend and companion of Mrs. Voynich over many years, was co-owner of the manuscript

It was purchased on July 12* 1961. by Hans P Kraus, New York antiquarian bookseller, for 524,500

Kraus valued the manuscript at \$ 100,000, and later at 5 1 60,000; he tried repeatedly to find a buyer for it at those prices

Finally, in 1960. he presented it to the Beinecke Rare Book Library of Yale University, where it now remains, catalogued as

manuscript 408, and valued at \$125,000 ro \$500,000. according to different sources. (Information concerning the modern

history of the manuscript was obtained from Tiltman 1968 and from unpublished notes kept by Miss Nill for herself a nd for

Mr. and Mrs. Voynich J

Chapter 2

Avenues of Attack on the Problem: A Survey

In this chapter 1 will attempt to cover as much as possible of the great variety of conjecture, reasoning, research, and

investigation chat has been carried out by a wide range of scholars, from Voynich down to rhose of recent sears. 1 have

arranged this material under a selection of topics relating to important characteristics of the manuscript, tits provenience,

date, original language, authorship. etc.L which have excited the curiosity and exercised the ingenuity of all its many

students. I can lay claim to a knowledge of only a small part of the work that may now be in progress or that may have been

done in the recent past; many people have undoubtedly carried on their work alone, and their ideas and results have become

known only to their immediate colleagues and* acquaintances. Anv dav now. a new announcement of success could break

upon the world from one of these students. 1 hope that the present summary, however incomplete, may

serve to cather

together more information about (he manuscript and its researchers than has hitherto been available in one place.

2J Conjectures Concerning the History of the Manuscript

Soon after his discovery of the manuscript, Vovmth undertook j very competent und thorough investigation it> In 'tor*

He turned up a wealth of interesting data, and succeeded in piecing together a plausible sequence of events to fill in most of

the blank spots between the known benchmarks. He traced che origin of the manuscript to Roger Bacon 1 1 21 4.; - 1 292?), a

learned Franciscan scholar and philosopher, renowned in later times for his occult powers. Of Roger Bacon much more will

be said below (see Sections 2,2.2* 3.1 and Chapter 7), Voynich stated that he had fastened upon Bacon as the most likely

candidate for authorship by a process of elimination, assuming, as he did. a thirteenth cemurv date for the manuscript even

before he saw the letter from Marci mentioning che similar belief held by someone at the court of Rudolph II Vovmch s

statement of his reasoning while examining the manuscript at the castle where he found it is worth quoting m full.

Evtn a nett'Uirih' brifl nifniiuiiin til che velium upon which tt wai written, the callifriphi. the drawing wnd (he pjirmems fun; treated n*

me u the date of in origin the Utter part of the thirteenth tentury The drjwingi indicated n tn be -in rncvrlupedu work urt ruiur.il phdm

second I v. the Franciscan Friar, ftoprtr Bacon, an infinite iv greater scholar, who had been persecuted on account of his writing* jnu whose

scientific discover'd had been mtvepresented as black magic. Moreover, for mans rears he had been forbidden bi his order to write

and he himjeif referred in his works to the neceuiry of hidmje his great secrets in eipher \mid 1021 . pp 4 L 16, j

Vovmch continues, relating his discovery of the Marri letter as follows:

It was not until some ome after the manuscript came into mv hands chie 1 read che document bearing che dice 166[^] <or iWfo-. which

was attached to the front cover. Because of tts Uie due l had regarded it at of no consequence, a no therefore neglected n durinc the first

examination of che rninuscrpt ' |P 416.|

He must have been gratified indeed to find his conjectural attribution of the manuscript to Bacon thus

dramatically corroborated.

Next. Vovmch turned his attention to teasing as much additional information as he could from the fans at his disposal. He

uncovered a quantity of fascinating detail concerning the personages mentioned in the letter and otherwise suspected to have

been associated with the manuscript, many of them familiars of Rudolph 11 and members of his court. The subject of

Rudolph, the scientific and pseudo- scientific movements that grew up around him* and the astonishing flock of scientists,

spies, charlatans, and other flamboyant personalities that converged upon Prague during Rudolph's reign, is In itself a

valuable area for study. The work published on this topic by Bolton (1904) is quite out of date, and while enjoyable reading,

fails to do justice to the subject in the light of today's scholarship. Evans (1973) provides a detailed, up-to-date presentation

on Rudolph and the elaborate and interesting culture surrounding hts court. Evans makes a untaiiingiv brief mention of the

Voynich manuscript, but does not add anything to our knowledge of its origin.

Here, in brief, is my chronological outline of the hypotheses Voynich put forward to fill the gaps to the known hisiorr of"

the manuscript, and to suggest further lines of investigation to complete the picture (all information m the outline below is

from Vovmch 1921).

3

Latter half of the thirteenth century. The manuscript was penned by Roger Bacon, as a record of his secret discoveries of sctence or magic.

— 1538.' The manuscript rested in some monastic library m England until the dissolution of the religious houses at the time of the Reformation; this destruction began in 1538.

— 1547? Many Bacon manuscripts (some say mi many as 1200 all told) were collected by Dr. John Dee, Elizabethan

mathematician and astrologer (of whom more will be said below in Chapter 8) He obtained these. Voynich suggests,

through his association with John Dudley. Duke of Northumberland, who amassed a large fortune through the rapacious

spoliation of religious houses during the Reformation. Our manuscript could have come into Dee's hands as early as 1547.

according to Vovnich. While it was in Dee s possession, he made vigorous attempts to decipher it. as attested by a remark in

a much later letter (dated 1675) quoting Arthur Dee. John Dee's son. to the effect that he had seen his father spending

much time over a book "all in hieroglyphicks" (on this matter, see also Section 8.9 below),

1584-1586. John Dec, failing in his attempts to decipher it. carried the manuscript to Prague on one of his visits to

Rudolph's court between 1584 and 1588. It was, then, to Dee or someone representing him that Rudolph paid the 600

ducats which was his price for the manuscript. It was probably also Dec who convinced Rudolph or others at the court of

Roger Bacon's authorship; Dee was to a considerable degree obsessed with Bacon throughout a large portion of his life, and

had a large pan in disseminating knowledge of Bacons work and refurbishing the reputation of the thirteenth* century friar,

condemned by tht Church and his contemporaries to centuries of neglect. Dee even claimed to be a descendant of Bacon

(whose real name. Dee claimed, had been "David Dee" and nor Roger Bacon at all).

—*1608? Rudolph made various artempts to get the manuscript decrypted by his stable of scholars and experts. In this

endeavor, he may have committed the manuscript, for working purposes, into the keeping of Jacobus de Tepenen. whose

name was written on it, and who may have kept it after Rudolph's abdication in 161 L and the subsequent looting and

dissolution of the Emperor s extensive museum and collections. Since de T e pc n ecz was ennobled in 1608, he could not have

written his name on the manuscript in the form we see before that date.

— 1622. de Tepenea died in 1622, and we have no evidence for the history of the manuscript between that time and its

appearance in the hands of its next known owner, Marri

— 1644? According to the Marri letter, the manuscript was in the possession of an unknown owner, mutual friend of

Marci and Kircher. for some unknown period; indeed, it may have passed through several hands during that time. It muse

have come into Marri's possession sometime before 1644, since Marri was able to discuss it with Dr, Raphael, who died m

that vear. Voynich suggests fp 419) that "research into the Bohemian State Archives will lead to the discovery of the

intimate friend of Marri and also of Kircher who had the manuscript between 1622 and 1 644.

— 1665/6. During the time between 1644 and 1665 or 1666. we are reasonably certain that the manuscript was in the

possession of Joannus Marcus Mara, and that it then passed into the hands of Athanasius Kircher. What Marci and Kircher

did with it while they had it. we do not know.

— 1912. Vovnich savs, "mv own impression is that Kircher left the manuscript to someone at the court

of Parma, where

he had patrons and friends, and it probably remained in the possession of a member of the Farnese family until, with other

manuscripts, it was removed to the collection in which 1 found it." (p, 430.)

Later researchers have added only a few details to this chronology so ingeniously ferreted out by Voynich. Brumbaugh

(1975, p, 347) suggests that Kircher himself may have deposited the manuscript directly into the Villa at Mondragotic.

John Manly (1921b, p. 188) claims that "it is dear that Marri did not possess the manuscript in 1640. when he was with

Kircher in Rome", since he would naturally have given it to Kircher then. He alio reports that Marri, in the preface of a

work entitled "Idearum Operatirium Idea", mentions as his mother-in-law one Laura, daughter of Dionisius Misserone.

who became director of Rudolph's Imperial Museum. Manly implies that Misserone could have been the unknown friend

who bequeathed the manuscript to Marri. Finally. Manly provides the interesting bit of information that the 600 ducats.

Rudolph's payment for the manuscript, would be the equivalent of \$14,000 in 1921. and he contributes some new dau

regarding de Tepenecz: this scientist was obliged to flee the country during disturbances that took place in 1618, and may

well have parted with the manuscript then, since it apparently remained in Prague.

Robert Steele, an eminent historian and Baconian scholar who has edited many of Roger Baton s works (Bacon

1909-1940), concurs with Voynich in connecting the manuscript with John Dee. He says, "Mr. Voynich is, we believe,

right in his conjecture that it was sold by Dee to the Emperor Rudolph at the close of the six te e n th century, attributing it to

Roger Bacon, and that it was probably the book containing nothing but hieroglyphics' of which Dee's son spoke to Sir

Thos. Browne * (Steele 1928b, p 563.)

4

2.2 Authorship and Purpose

2*2,1 A Hoax, a Forgery, or Nonsense*

Mary students have had, at times, an uncomfortable suspicion that the mysterious codex upon which so much fruitless

effort had been spent might be a fabrication, its teat representing nothing meaningful or orderly enough to be capable ot

decipherment and transit non Wilfrid Voynich seems to have felt that the manuscript was unquestionably a genuine

production of a thirteenth -century author, and specifically of Roger Bacon. Dr. Albert H. Carter (one time technical

historian of the Armv Security Agency) states the opinion shared by most students who have grappled with the elegant puzzle

when he says. 'So much time and so much expense in vellum of excellent quality went into it. it cannot be a hoax. It is

conceivably the work of a wealthy and learned, if deranged* person, but not a hoax" f 1946, p. I). In an early report. John

Tiltman, one of the most faithful and thoroughgoing of the manuscript s students, expresses his considered confidence in its

authenticity: "I do not believe the manuscript is completely meaningless, the ravings or doodlings of a lunatic, nor do 1

believe it is just a hoax — it is too elaborate and consistent for either. , . , About the worst thmg it can be is a deliberate

forgery for gain. . . , I regard this as rather improbable- -. V <195 1 , p. 1 h

In a more recent presentation, Tiltman reiterates these judgements, refusing to accept suggestions that the manuscript

contains only "meaningless doodlings". He continues* "There is more sense to the idea that the work is a forgery. This I

think is highly unlikely* especially if Captain Currier's ideas are correct " (Tiltman 1975; the reference to Captain Currier

concern? his findings of multiple "hands" in the text, for which see Section 6.8 below.) Erwin Panofskv. a prominent scholar

of medirval and Renaissance studies, added the weight of bis learning to this view: 1 should like to reiterate my opinion

that the Voynich manuscript, whichever its place of origin, date and purpose, is certainly a perfectly authentic document

(1954. p 3). Finally, Elizabeth Fnedman, wife of William Friedman (prominent cryptologist and student of the

manuscript) and a distinguished scholar and cryptologist in her own right, expresses a similar opinion: All scholars

competent to judge the manuscript . . . were — and still are — agreed that it is definitely not a hoax or the doodlings of a

psychotic but is a homogeneous, creative work of a serious scholar who had something to convey " (1962 1.

At least one recent researcher has spoken out in favor of an opposing view, stading that the manuscript is in fact a forgery,

and may contain a considerable quantity of meaningless "dummy" text intended merely to fill it out to an impressive length

Robert Brumbaugh (1974, 1975, 1976) claims that the book was expressly and calculatedly designed by some sixteenth-

century opportunist in order to fool the Emperor Rudolph into parting with the large sum of money that he did. indeed

spend to obtain it. To this end, the text was provided with a wealth of apparently easy "keys", and just enough easily deci-

pherable material on the last page to convince Rudolph's experts that it would prove to be readable with the expenditure of

a reasonable amount of effort. Faked "evidence" was also planted on the last page, according to Brumbaugh, to associate the

secret book closely to Roger Bacon — that exciting and mysterious possessor of impressive scientific and occult powers in

whom John Dee had been busily raising interest to a fevered pitch at Rudolph's court.

In spite of all this, Brumbaugh shares the view that the manuscript is not totally meaningless. He says, "There is an

underlying text . . , and sooner or later, by collaborative work* it will be read. There is no way of predicting what it will sav:

it could be anything from a standard botany textbook to formulae for the Elixir of Life deriving from Roger Bacon" (1975.

p. 354). Father Theodore C. Petersen, another dedicated long-term student of the manuscript who possessed a wide

background of learning in hiitory and philology, expresses his view thus: "There is agreement that the text of the Vovmrh

manuscript obeys uniform rules which are constant and unchanging throughout the whole 246 extant quarto pages of

writing — indicating that the script contained an intelligible meaning for its writer" (1953. 1)-

Newbold, Feely, and Strong, the three other principal claimants (besides Brumbaugh) to some degree of success m

deciphering the manuscript, all accepted it as a genuine and serious production either of the thirteenth or the sixteenth

century. William Friedman also, while not to my knowledge associating the manuscript with any specific author, regarded it

as a valid document with some content capable of being deciphered and read.

Some students of the manuscript, and others who disclaim any interest in it, have advanced the view char its content can

have no value for science or for the study of human thought. Tiltman. in his early report to Friedman, says. "I do not in any

case imagine there is anything historically or scientifically important contained in the manuscript" (195 1, p. 1 I: this, in spite

of his deep and long -continued interest in the problem and his firm rejection of the theory that the manuscript is completely

meaningless or fraudulent. Elizebeth Friedman indicates that the lack of serious interest in the manuscript on the part of

scholars was. on at least one occasion, a cause of disappointment to her husband in his research: "'It appears to be gibberish to

many serious- minded academics, who are apt to scoff at the idea that its solution would be of any value to science or

learning — as did a great foundation to which Friedman once applied for a grant for the detailed study of the manuscript. In

the opinion of the board, a solution would not advance human knowledge. The manuscript probably contains only trivia, the board said." (1962)

J must confess that J cm see link justice m the reasoning of those academics' who dismiss the Vovnich manuscrpi out of

hand, after what cm only be the most superficial attention, Even if it is. in fact, a fabrication associated with the court ot

Rudolph 11. an under standing of who wrote it. its passage from one to another of Rudolph's familiars, and the part it played

tn the remarkable congeries of religious and political aco vines at Prague in those omes could prove to be of great interest In

the history of thought, it is not the intrinsic importance of a work that matters so much as its place within a larger pattern of

events and meanings. If the manuscript is a compilation, however "deranged" or idiosyncratic, drawn from earlier magical,

alchemical, or medical works, it his at least as much intrinsic interest and "scientific" import for the history of Western

thought as do other similar manuscripts which are readable, and concern only one topic (i.c., they are either astrological, or

alchemical, or medical). Reputable scholars apparently see no wane of a me m studying plaintext manuscripts of this type.

and may spend much of their lives so occupied

The Vovnich manuscript appears to be unusual in that n combines in one book at least four differrni medieval disciplines,

apparently with some attempt to integrate them into a single system. If read, it could provide a highly interesting picture of a

theory or doctrine interrelating all these disaplines, at least in the beliefs or practices of one individual or school. Finally*

even if the text is totally meaningless (a possibility that seems to me highly unlikely), a decipherment of the text in some

manner per mining an understanding of the code, cipher, or other concealment system employed should be of great interest

for the history of crrptology. and perhaps also for the stud? of alphabets and writing interns. In summary. 1 could accept a

finding that the manuscript was a hoax or a forgery: I might

also accept the presence of a Large amount of dummy or tiller

text, to pad out the length of the document or to act as "cover" text within which a shorter message is hidden. I cannot,

however, see any justification for dismissal of the manuscript as trivial or unworthy of careful and systematic study We can

assess its value for human knowledge only effer we have read it. or at least learned quite a lot more about it.

2.2.2 Who Wrote It, and Why?

Roger Bacon (A.D. 12I4/-1292/) as Author. Voynich, as we have seen above, was certain of Bacon's authorship from

the outlet. His reasoning, presented above (Section 2.1) need not be recapitulated here. William R. Newbold, the first would

be decipher of the secret book, maintained chat Bacon wrote it. as a diary of novel scientific researches unacceptable to the

Church. He intended the book, according to NewboJd. for his favorite pupil John, or for some other dimple or friend,

providing the recipient with an oral key subsequently lost The first chapter of the book describing New bold s findings

presents an excellent sketch of Roger Bacon's life, writings, and thought, indicating that he had made a thorough study of

the thirteenth -century friar and his works f 1928. pp. 1-28). J. Malcolm Bird (1921 J accepts Newbold's decipherment. and

the attribution to Bacon, in favor of which he provides a lengthy justification.

At least two other objective and painstaking researchers agree that there is no conclusive evidence against the original

authorship of the manuscript by Bacon (whether it is in his autograph hand or represents a later copy of his work i. John M

Manly (prominent literary scholar who later refitted Newbold's solution) expressed his opinion thus in an early comment:

"That the manuscipi is Bacon s. or even that it dates from the thirteenth century, cannot then be proven by documentary

evidence, but there is no evidence against this tradition, and the appearance of the manuscript itself confirms it. . /* f 1921. p.

189). Tikman concurs with this view: "There is as yet no solid evidence that the manuscript is not by Roger Bacon, or a

copy of a work by him" (1968, p. 13). A number of prominent Baconian scholars accepted, indeed hailed with enthusiasm.

Newbold's claim to have proven that Bacon was the aurhor (Canon 1929; Gilson 1928), For further discussion of this

question, see Chapter 7 below.

Roger Bacon Not the Author. Others are just emphatic in their rejection of Bacon either as the scribe or contributor of

any comem in the manuscript. The objections of some revolve around their rejection of an early date for the book, and their

apparent unwillingness to consider it as a later copy of Bacon s work. They are opinions of experts dating the manuscipi

around J 300. and therefore much too late to have been a work by Bacon, or even likely to have been a copy f most copies of

Bacon's works that have come down to us were made m the fourteenth and fifteenth centuries). Still others repea Baconian

authorship not. apparently, in general, but specifically as a pan of their emphatic rejection of Newbold's decipherment and

his attribution of the manuscript to Bacon, along with such impossibly anachronistic activities as the invention of the

compound microscope and telescope, and their use to observe events within a frame of reference completely foreign to

Bacon's times. Erwin Panofrky has slated flatly that "The Roger Bacon theory is in mv opinion at

variance with all the

available facts and has been convincingly disproved by Mr. Manly" (i.e., in Manly's articles demolishing New-bold's

theories) (1954. p. 2). Dr. Charles Singer, eminent historian of science, said in a letter to Tikman (12 November. 1957). I

came to the conclusion that all suggestion of a knowledge of the microscope [again referring to New bold s decipher merit j

6

was simph nonsense "Final I v. Lvnn Thorndike has. with characteristic emphasis, stated his opinion that There is hardh

one chance in fifty char Roger Bacon had any connection wirh the production of the Vovruch manuscript. ' i 1 929. p. 5 1 9i.

Anthony Askham as Author. Dr. Leondl C Strong (whose claims to a decipherment of the manuscript are discussed in

Section 5.} bebw). insisted that the author was a sixteen di-century physician named Anthony Askham for Ascham), who

had published several almanacs, astrological works, and an herbal. (Tiltman has ferreted out references to a number of these,

as early printed books: see Askham I34Ba, 1548b, 1530. 1552, and 1553J Strong claimed, further, to have deciphered

Askham s name on folio 93 of the manuscript No other student has accepted this theory, and Strong s proposed readings ol

the text have been emphatically re jeered

Other General Suggestions Regarding Authorship. Dr. Carter claimed id see evidence of "a copvist at work - ' 1 1046. p

1 h He mentions duplication among the zodiac diagrams, there being in fact two leaves showing the Ram, Aries, and two

showing the Bull, Taurus, (These diagrams are, in actuality quite different when examined carefully, and the apparent

' duplications" arc only superficial; the pairing of diagrams for these two zodiac signs clearly had some definite purpose

known only to the author of the manuscript J Xh. Singer, in a letter to Tiltman f 1 2 November, 19571 expresses the opinion

that the origin of rhe manuscript was somehow related to Rudolph's court and to John Dee. While he does nor tun her

specify the nature of the connection, one gains the impression that he may have had in mind an idea similar to Brumbaugh *

discussed above. Panofsky states the following view; "My idea always was that the manuscript was written by a doctor or

quack trying to impart what he considered secret knowledge to his son or heir" 1 1954. p 21,

2.3 Provenience and Underlying Language

England. Medieval Latin. Voynich, as we have seen* traced the manuscript to Roger Bacon, in the England of the late

thirteenth century. He probably also, therefore, assumed the underlying ''plaintext" to be the medieval Latin of the Schools,

used by Bacon in all his surviving works. Newbold (1928, p. 44) also gives the manuscript an English origin, claiming to rest

his opinion on "the judgement of experts" not further identified, based on the parchment, ink and style of the drawings. His

proposed decipherment produced a form of medieval Latin. The language which Feely fl 94 3) claimed to have discovered m

the manuscript was also Latin, but in a system of abbreviated forms not considered acceptable by other scholars, who

unanimously rejected his readings of the text

England. Medieval English. Leonetl Strong (1945) maintained that he had deciphered rhe text as medieval English, as

we will see in Section 5*3 below, other students have rejected his theory and the plaintext he produced, both as valid

medieval English and as a correct decipherment of the Voynich text.

Unspecified European, Latin. Elizebeth Friedman (1962) states that her husband, William Friedman, agreed with other

qualified experts that "the country of origin is definitely European; it might be England, France, Italy, or what is now

Germany." She adds, further, that "the text is based upon a written language that is probably Latin, the language of all

learned and scientific discourses of that period, but may be medieval English, French. Italian, or Teutonic, "These views

seem to Leave us with a discouragingly wide choice, indicating that the 'experts" could fix upon no definite evidence to

narrow the area of their search.

Italy. Hellmur Lehmann-Haupt. Bibliographical Consultant to H. P, Kraus (owner of the manuscript between 1962 and

1969), suggested in a letter to John Tiltman dated I November, 1963 that Italy was a likely country of origin. He states.

"While both palcographicaJly and historically speaking, Italy is as likely i place of origin as any other country of Europe,

there is no evidence that the manuscript must have been made in Venice, or elsewhere in Northern Italy. The possibility that

it comes from Central or Southern Italy is soil open, and this could very well mean exposure to the Arab world. "He proposes

that Arabic should be considered as a candidate for the underlying language. Robert Steele suggests that some of the writing

on the last page may be "perhaps in a North Italian hand" (1928b, p. 564). Brumbaugh draws evidence from details in

some of the drawings for his theory of a relatively late date and a European provenience. Thus, in one of the zodiac- like

circular diagrams, he says "Sagittarius wears a Eft tenth -century Florentine archer s hat in his

medallion (though it is retouched over the month name)" (1975. p. 349).

Germany or Eastern Europe. Charles Singer, in a letter to Tiltman dated 12 November, 1957, states hts feeling that the

manuscript is "of Germanic origin", and "connected with John Dee and that sort of movement. " He gives a somewhat fuller

statement of this view in another letter to Dr. G. M. J. Flemming, undated but obviously written at about the same time:

'The judgement that I formed upon the manuscript was that it was of the sixteenth century, of South German work and

possibly related to Prague and John Dee." Singer also suggests that Czech. Polish, or some other East-Central European

I

language should be considered to underlie the teat. Fortunately for students of the manuscripts, whose difficulties are already

sufficient! v burdensome, he considers Magyar "highly unlikely."

Doth Singer (in the letter to Flemming) and Panofsky (1954. p. 2), mention a reading of some scattered phrases on the

Last page as High German; this reading was proposed, apparently in a private communication, by Richard Salomon of

Kenyon College. Dr. Salomon suggests that a portion of the text in a mixture of scripts should be read: so mm gcismi $[L \mid ch]$

o', representing a medieval prescription meaning "(If such and such a condition prevails), then take goat s milk or

This "prescription", which breaks off in mid -sentence, Salomon sees as continuous with the preceding text on the line He

suggests an interpretation in German also for the brief words found on folio 66t. near a figure of a man Iving on his back as

if sick or dead, and surrounded by several ambiguous objects. He reads the text as "der muisteiJ", referring to the obligators-

endowment of a widow with household goods on her husband s death.

2.4 Date of Origin

Thirteenth or Fourteenth Century. Voynich (1921, p 415) assigned the manuscript to the latter half of the thirteenth

century, as we have seen above. New bold stated thar in the judgement of experts." a study of parchment, ink. and style of

drawings placed the manuscript in die thirteenth century. (1928. p. 44). Petersen says, "T agree with Mr, Tiltman that the

juxtaposition of a herbal with (he kind of astrological tables found here indicates a fairly early due for the manuscript. The

thirteenth century manuscripts of St. Hildegardt of Bingen show drawings illustrating the influence of

the heaven 1 v bodies

and elementary celestial forces upon the vegetative and animate life of the earth. The fourteenth century manuscript Vatican

1906 has somewhat similar astronomical drawings' (1955, p 2). Steele provides the following interesting comments, with

the benefit of his expen knowledge and personal familiarity with medieval manuscripts (and in particular the works of Roger

Bacon): 'The usual methods of dating a manuscript (mil us. the writing cannot be placed, the vellum is coarse for the

thirteenth century, but not impossible, the ink is good. Only the drawings remain, and owing to their complete absence of

style the difficulty of dating is but increased. It is strange that the draftsman should have so completely escaped all medieval

or Renaissance influence" (1928b, p. 565).

Fifteenth Century. Hugh O'Neill, a prominent American botanist, published an identification of certain plant drawings as

New World species: "The most startling identification. . was folio 93. which is quite plainly the common sunflower.

Helianthus Annuus L. Six botanists have agreed with me on this deter nu nation. This immediately recalls the dace 1493.

when the seeds of this plant were brought to Europe for the first time (by Columbus on his return from his second vovage).

Again folio 10 Iv shows a drawing which does not resemble any native European fruit, but suggests plainly Capsicum, a

genus strictly American in origin, known in Europe only after the above date. . , . It seems necessary to consider this

manuscript as having been wrinen after 1493" (1944. p. 126) Other scholars, however, completely revert O'Neill's

identification of the sunflower and p ep p er plant, and ire as emphatic in their claim that none of the plants pictured in the

manuscript are of New World origin. Helmut Lehmann- Haupt (bibliographical consultant to H. P. Kraus J stated in a letter

to Tiltman dated l November. 1963, that "there is a near agreement on the date of the CIPHER manuscript as around, or a

little after, the vear 140G."

Sixteenth Century. Panofsky adds his voice to these suggesting a late date for the origin of the mysterious codex: 'Were it

not for the sunflower [as identified by O'Neill] . . . 1 should have thought that it was executed a little earlier, sav about 1470.

However, since the style of the drawings is fairly provincial, a somewhat later date, even the first years of the sixteenth

century, would not seem to be excluded. I should not go lower than ea. 151 0—1320 because no influence of the Italian

Renaissance style is evident. The above date is based on the character of the script, the style of drawing and on such costumes

as are in evidence on certain pages, for example folio 72 recto | probably referring to the costumes in the Gemini

representations]." (1954. p. 1). Eliaebeth Friedman states the consensus of expert opinion at the time as follows.

"Paleographic experts agree that the nature of the drawings, the writing, the ink and vellum, etc., indicate that the

manuscript is certainly of later origin than the thirteenth century. The female figures, for example, are not the angular forms

characteristic of that period but are of a later, rotund, period. Some experts suggest that the probable period in which it was

wrinen was 1500, plus or minus twenty years" (1962),

A. H. Carter reports the similar judgement of Miss Nil! (a friend of Mrs. Voynich who accompanied him when he

examined the manuscript in (1946): "The style of the drawings, especially the conventions of the line drawings in the

women, suggest to Miss Nili, quite properly, that the manuscript is far later than the thirteenth or fourteenth centuries.

There is nothing Gothic' or angular about them. They are fac and rotund and suggest in their style the influence of the

8

realism of a later period. The coloring of the illustrations may well support a Uter date than the thirteenth century' t 1946.

P->>-

Among those agreeing on a sixteenth * century date for the manuscript is Dr. Charles Singer, who states in his letter to John

Tillman (12 November. 1957), "The date of the manuscript would* in my opinion* be somewhere in the neighborhood of

1320 or perhaps a little later. . . We hive already seen that he connects the origin of the manuscript with John Dee and

Prague. Leonell Strong makes an interesting suggestion, that "The format and use of certain peculiar symbols (mirror images

of the Italian d or di and eh respectively) are evidences that the author was probably familiar with the manuscript of

Leonardo da Vino's 'Anatomy' (written about 1510)" (1945. p. 608)* Strong's identification of Anthonv Askham as

author of the manuscript also leads him to place it in the sixteenth century, since Askham s known works were published

from 1525 on.

Robert Brumbaugh presents perhaps the most detailed and specific evidence for a sixteenth -century date: . .it seemed

plain to me from the outset that this is not a thirteenth century 1 manuscript, and I doubted whether Rudolph II or any of his

experts ever had accepted it as an autograph. work by Roger Bacon. Detail after detail pointed to a later date closer to 1500

than 1500. * , .Sagittarius wears a fifteenth -century Florentine archer s hat in his medallion (though it ts retouched over the

month name). A clock, tucked away in folio 85 l has a short hour and long minute hand* a style not developed until rhe

fifteenth century. . . In short, this manuscript is at earliest a compilation of about 1500" (1975. p. 349). (A number of the

points Brumbaugh employs to bolster his argument depend upon his own decipherment and associated specific identifications

of the symbols with numerals* etc.; I have omirted these, retaining only his more objectively based comments For further

discussion of the "dock", see 33*6.)

Finally, Jeffrey Krischer obtained, in the course of his research, the opinions of a number of experts at Harvard Umversin

concerning the date and provenience of the manuscript (see Section 6.7). He reports their judgement as follows:

Profeuor G iki Cwutibk (proftwr of medieval history, Harvard University), in looking over ph«o«aij of the manuscript, dated tht

roamacTipi as jiateemh century and iuggemd thir the script might be a form of private lanftiage motivated by the desire to keep such j

powerful document from the general public Science in this period represented: power and if one inumn the minuwrnpt u indeed destribme

plana and bdoficii and astrological phenomena, then dm line of reasoning u quite acceptable The date of the manutenpt was again placed

in the sixteenth century by Mr Rodney Deimti (curator of manuscripts in Houghton Library of the Harvard College Library t Mr Defintt

identified the script to be m the ttyle of the sixteenth century immtnjif script, Another dating of the manuscript «*s due to Dr franklin

Laddert Dr Ludden determined the date « being m the period 1475 to 1 550 His mettiod of dating if based upon anal vim* the ttyle of the

drawings; the features of the nude figures; the HvJiiation of the botanical drivings/ \mid Kmdier J 969. pp 5 1 -52. \mid

In consideration of this review of many pronouncements made by scholars and experts, I have made a rough box score

summarizing their opinions. Jc is crude* but it may aid the reader in bringing some order out of the multiplicity of

judgements that have accumulated over the years during which the mysterious manuscript has been studied, in the tally

shown below, I have arbitrarily assigned a score of "2" to such statements as "in the judgement of experts, or the

consensus of opinion", and a score of " 1" to the opinion of a single writer, without attempting to weight them in any greater detail*

dates score

1250-1399 5

1400-1350 12

To mv mind, this summary of expert opinion does, in fact, lend considerable weight to a relatively late date for the manuscript.

9

Chapter 3

Avenues of Attack: The Drawings

3. 1 Relationship of the Drawings to the Text

If has been suggested by some students* baffled and exasperated by repeated, futile attempts to make sense out of the

pictures as a way of cribbing into the text* that there may be no necessary connection between the writing and the illustration

on any given page. The pictures, some have proposed, may be a "blind", introduced to mislead the would-be decipherer and

further conceal some dangerous secrets of a totally different character Most serious students of the manuscript appear to be

certain, however, that text and pictures were drawn together and form a related whole. Eiixebech Friedman states, for

example. "There can be

no question that the same scribe wrote the text and made the drawings, as any handwriting expert would readily agree" { 1962).

Dr. A, H, Carter concurs in the above opinion: "Because the same ink and the same kind of penstrokes appear in the

illustrations and because the text forms an integral and unified pan of many of the illustrations, it appears probable char the

same pc son wrote the text and drew the illustrations" f 1946. p. 1). Tikman feels that we have a right to expect that the text

belongs to the illustrations $\mbox{\tt "in}$ the complete absence of evidence to the contrary $\mbox{\tt f 1968.}$ p U) . In the view of those w ho

have studied the manuscript with care* the text seems to be intricately interwoven in and around the pictures in such a wav us

to have rendered a dose collaboration necessary between scribe and draftsman if they were, in fact, different persons. In some

cases, text strings are written on parts of pictures (for instance, as labels on the objects called "pharmaceutical jars" by many

students in folios 99r and 102v2, and in the segment* and cells of the intricate diagrams on fohos 85-86 as well as many

astrological and cosmological drawings.

3*2 Nature and Characteristics of the Drawings

The impression made upon the modern viewer first coming upon a photocopy of the manuscript It he form rn which it has

most frequently met the eye of students), is one of extreme oddity, quaineness, and foreignness — one might almost sav

unearthliness. To the reader who has seen pictures of more typical illuminated medieval manuscripts, these pages look verv

different indeed from what he expects to find m such a book. For me. at least, after working with the photocopy intensivdy

for some weeks* the initial impression of ' 'queerness'' lost its prominence and gave way to other, more considered reactions

which may be summed up as follows:

Homogenciry of Stvie. The drawings and text of the entire manuscript seem to me to form a consistent whole, the product

of one school or group of closely related persons if not of a single person.

Craftsmanship and Pragmatism. The scribe (or scribes) seems nor to have been motivated by design or esthetic criteria any

more than by what we. today, would consider realism. Many of the plant folios and some cosmological designs i notably 9r,

1 Iv, 16v. 33v* 41v* 49r, 68v2, 67 r 1 , 67r2, and 6Svl) present a stalwart, bold fehcity of composition that is almost

architectonic in its quality, and {to me) quite pleasing. The impression which I receive is emphatically one of craftsmanship

rather than art.

Structural Regularity. I gain a persistent impression of the presence of rules and relationships, a definite structure with its

own "logic"* however erratic and bizarre it might appear when compared to prescm*dav concepts. The intricate compound

forms in the script and its matter -of- fact, rather austere style all confirm this impression of craffsmanlike and logical

construction in my mind. As 1 will try to show below, there appears to be a similar quality in the diagrams, as if

conventionalized forms are used almost as symbols and combined to build up more complex symbolic statements. As a part of

this quality of const ructed ness," there is a persistent tectonic element of style in the drawings, emphasizing three*

dimensional forms* symmetry, and connectedness of parts.

Idiosyncratic, Individual Quality. As has been noted by others, the manuscript seems to stand totally apart from all other

even remotely comparable documents. No one. to mv knowledge, has so far discovered anvthmg else at all like it. ft strikes

the viewer as a very strong and definite statement* completely independent of any known si vie or

doctrine. It seems to be

deliberate, designed production of an individual or a small group working alone. (This apparent isolation mar. of course, be

due simply to our failure to discover the other documents or philosophies related to it, but it seems unlikely that no trace of

such parallels would have been recognized by the many eminent medieval and Renaissance scholars who have examined the

11

manuscript*. In Section 3-2-3 I will discuss some other manuscripts that have been mentioned as poisibly comparable to the Voynich manuscript.

The above ire my own impressions of the visual qualities of the manuscript; we will see bdow how some other students have reacted to it,

3*2* / Provenience and Style

Voynich communicates his impression of the contrast between this manuscript and the other, more typical medievil

manuscripts who which it was found: "It was such an ugly duckling compared with the other manuscripts, with their rich

decora Dons in gold and colon, that my interest was aroused at once " (1921. p. 413 k Dr Carter provides a detailed

description of the man user: pi, with considerable emphasis on the draftsmanship, pigments, and srvle; his personal reaction is

as follows: "The illustrations are done with great care, not with attention to providing a pleasing picture but rather with

attention to accuracy of detail. They arc, as Mns Mill pointed out. the kind of drawings that a scientist would make for

himsdf. not illustrations designed to enhance the beauty of the book" f 1 946, p. Ik

Students disagree to some extent on the quality of the drawings as accurate portrayals of their apparent subject matter

There is also considerable disagreement in ot surprisingly) about their esthetic quality. To some, they are pleasing; to others,

they seem clumsy, inept, and childish. An anonymous author in Scientific American takes a critical and contemptuous view

"These pictures are crudely drawn in by a person who obviously was somewhat lacking in artistic abiliry, even lor a

thirteenth -century scribe" (1921, p, 432)* Again, the same author expresses a similar opinion a few pages later: The senbe

was not a great success as an artist, his efforts sometimes remind us of the crude outlines we produce m impressing upon a

draftsman what we want and how we want it" (p 439). Charles Singer, in his letter to John Tilunan. 12

November 195",

expresses a similar contempt for the represen cation* I and artistic quality of the plant pictures: "The figures of plants are not

botanical at all but of the kind one makes when doodling or the children make of plants."

As will also be noted in the discussion of the script bdow (4.1,1), while many students have briefly mentioned the style of

the drawings as a factor in their judgements concerning the date and provenience of the manuscript, none of them provide

any real faro to back up their remarks beyond a vague reference to "experts" not further identified- As we have seen above.

Steele remarks, it is strange chat the draftsman should have so completely escaped all medieval and Renaissance influences

(1928b, p, 563). Carter { 1946) refers to the "rotundity" of the human figures and the lack of "Gothic" style as evidence

for a date later than the thirteenth or fourteenth centuries. Panofsky (1934. p, 1) assesses the srvle of the drawings as 'fairly

provincial": he also states that there is no evidence of influence from the Italian Renaissance style. In sum. it appears as if no

one has made or documented a really careful and systematic attempt to contrast and compare the style of the Vovmch

manuscript drawings to other manuscripts of various origins and dates such as could answer some of our questions

3*2*2 Pigments and Inks.

Dr. Carter provides a detailed description of the pigments. This deserves to be quoted in full, in spite of us considerable

length, since few students ever get to see the manuscript in any other form except black and white photocopies.

Some of the colon appear to be colored ink or water color, tome a kind of era ton. and Kune an opaque kind of paint like potttt paint

There are many colors, the ink i* pnd uroit brown, there it an amber. like ink. like Bfimh-tan leather floods: a bright, not quite brilliant

blue mk or water cdor: an opaque aquamarine, a food stronje red. carmine rather thin scarlet or vermilliOA. a dirt* rellow [the tellow and

browns of the sunflower illustration are like those , only a little faded, of the Van Gogh sunflower picture; the greens are ku bn llum i . a

red that looks like a bloodstain about a week old: a dirty green: an opaque green, a kind of green ora eon. and arreral other greeiu of vinous

huts. intetuitY. value, and feature, a red that looks like (set rouge in color and tenure; a thick red that makes docs of color that vou could

scrape with wt finger nail; a red ink iust tike ordmarT red ink today, a blue that qsarkks wuh any fragments foot apparently by design;

Some of the colon are flowed on as wrth a brush: so me have left pigment-borded contours at where a little pool had wood unbiortee

Some mar have been blotted (with doth?! Some were applied with strokes of the quill, and tome were

scrubbed into the vellum with a

blunt quill which had become furry on the end U a wooden stylus does after r ep ea ted use." | Garter 1946, p. 2.|

3.2*3 Relationships to Some Other Illustrated Manuscripts .

My sources have disappointingly little to sav on chu topic. One gams the impression, whether justly or not, that the bizarre

quality of the pictures and the difficulty of identifying with any certainty what they portray, has caused most scholars

familiar with more conventional medieval manuscripts to throw up their hands in disgust after the most cursory glance The

"herbal" pictures of complete plants and the astrological diagrams associated with recognizable zodiac figures offer perhaps

12

the most immediate promise tor comparisons ro other herbal or astrological drawings. Panofskv (19^-i, p l addresses the

problem as follows: "Manuscripts in plain Language remote ly comparable to the Vovnich manuscript are, unfortunately

of m

least four kinds: first, herbals: second, cosmological and astrological treatises; third, medical treatises in the narrow sense of

the term, fourth, possibly, treatises on alchemy," He suggests that the mystical drawings of a thirteenth -century monk.

Opicmus de Canistris. may be worth examining as comparable astrological and cosmological works. Father Petersen t 1 97 3.

p. 2). mentions the visionary writings and drawings of St, Hildegarde of Bingen as possibly comparable, and he recommends

the fourteenth -century Vatican manuscript 1906 as similar to some of the astronomical drawings,

Tihman states his considered opinion: "To the best of mv knowledge no one has been able to find anr point of connection

with am other medieval manuscript or early printed book. This h all the stranger because the range of writing and

illustration on the subject of the plant world from the early Middle Ages right through into the sixteenth and even

seventeenth centuries is verv limited indeed" i 1968. p. Ill, Elizebech Friedman expresses her own and William Friedman s

views when she states flativ, "So far as is known, there is no , . . kev or crib," (19621 (For those unfamiliar with the term as

used by cryptanalysts, a "crib" is a parallel or comparable text in a known language that can be used to break into an

unknown text as the three parallel inscriptions in different scripts on the Rosetta Stone were employed in the decipherment of

Egyptian hieroglyphs. A crib can also take the form of a guess as to the subjen matter, or individual words that might be

found at certain places in an unknown text, 1

Opicmus de Camstris IA.D. 1296-ca 1336). R Salomon i 1936) describes the visionary and mystical drawings of this

monk an shows extensive illustrations of them. Born in Pavia, Italy. Opicmus had a difficult and unhappy life, he idl and

injured his head as a child, a mishap which may have had a central part in the later episode of illness and visions which he

recorded in the remarkable book of drawings studied by Salomon. The draftsmanship is very delicate and beautiful, with an

artistic quality totally different from that of the Vovnich manuscript. The designs are extreme! v dense and intricate, with

many concentric circles, intersecting arcs and lines, and bands densely packed with tmv sets of numbers and letters. Many of

them show careful! v -drawn human figures with well-drafted maps of the world and other, smaller human figures inside

them or interlocking with their outlines.

Maps and architectural plans are a prominent feature of Opirinus' productions, as are Biblical symbols such as animals

standing for the Four Gospels, and the signs of the zodiac One drawing shows his entire autobiography, from his birth up to

the year 1 335 or 1336 (when he drew the pictures), all packed onto one page. They are all ciosely overwritten with Latin

text, in very tmy. near letters: the text is primarily about Opicmus himself (his feelings, his sinfulness and unworthiness,

events in his life, etc,) represented in symbolic wavs interwoven with religious symbolism and quotations from the Bible and

patristic writings The only real similarity to the Vovnich manuscript drawings is the encyclopedic quality, in combining so

many disparate elements symbolically within a structural and semantic unit. The appearance and sryle of Opicmus

productions are totally at variance with these of our manuscript: Opicmus was a trained artist and draftsman, and had

produced an earlier book of beautiful architectural drawings of his native town. Pavia, as well as a number of devotional

religious Tracts.

St. Hildegarde de Bingen f A.D, 1098-1 179). St. Hildegarde. abbess of a convenr in Germany, was gifted with powers of

propheev and mystical vision. She produced several books describing and illustrating these visions, as well as a book about the

causes and cures of disease. Her drawings appear considerably more like those in our manuscript on the face of it; they are

relatively provincial and crude." and have none of the delicacy and professional quality of Opicmus' drawings

Hildegarde's drawings have some of the same symbolic, "constructed" quality as those in the Vovnich

manuscript. They

show rather different elements of content, however: animal heads and recognizable figures of Christ and the Virgin, for

example. Some of the drawings appear ro have banks of ravs, clouds, or flames similar to those on some Vovnich manuscript

folios.

There is little or no text or labelling within any of the illustrations I have seen of Hildegarde's works: their mean me is

explicated in connected ten elsewhere in the books. Their symbolism, as explained there, is entirely Biblical and Christian u

sun dike ball of flame represents Christ's burning love: three smaller stars above it are the T rimer; heads spouting vapors are

people preaching the Gospel or using words to do the work of the devil, etc.). The designs have a highly symmetrical,

abstract quality similar to many Vovnich pictures, and some have similar arrangements of small cells or radiating lines in

bands around a circle. It is amusing to note, after all the pontifical ions of experts about rotund figures and the absence of

Gothic sttrle in the Vovnich manuscript, that Hildegarde's twelfth -century human figures are well -filled -out, vivacious,

plump, and lively. (For a good discussion of Hildcgarde's works and reproductions of many drawings see Singer 19^5 np

1-58J

13

In spue of all the above pomes regarding general similarities. 1 cannot see any reilltr close kinship between these drawings

and those of the Voynich manuscript. The main import of the comparison with Opicinus and Hildegarde s productions is to

demonstrate that such individualized, encyclopedic* symbolic works were by no means uncommon in the Middle Ages. The

astrological manuscript (Vatican 1906) referred to by Petersen is not really very similar to the Voynich p*cmrcs either a

ft refill study of the numerous illustrations of this and other simitar manuscripts (in Sax I 1915 and 19271 shows very few

parallels to the cosmological or astrological diagrams in our manuscript. Most such medieval astrological pictures feature

human figures* figures of animals, and other clearly recognizable graphic elements which are much less prominent in the

abstract style of the Voynich drawings.

33 Content of Specific Classes of Drawings

At the risk of bonng some readers, I will go into the appearance of the drawings in some detail in the

following

paragraphs: for various reasons, it is not possible to reproduce many of these folios for inclusion in this paper* and so a verbal

description must suffice to convey some idea of their content to the reader who cannot obtain access to a photocopy of the

manuscript. None of the sources 1 have studied has accorded much attention to most of these diagrams* or discussed their

content in any way, excepting for a few passing mentions of details on this or that folio which some student happened to find

useful or suggei ve in connection with a particular theory of his own. Therefore, 1 hope the reader will bear with me

through the following somewhat length? discussion of individual drawings, and my attempt to come to grips with their

specific content and detail. Figure 4 provides an overview and classification of the folios according to thar apparent subtea

matter

33* 1 Herbal Drawings.

At first glance* the numerous illustrations of whole plants, usually accompanied by one or more paragraphs of text, seem

to offer the best hope of a successful attack on the enigma. Other students have bent their efforts vigorously to the task of

relating some, at least, of these drawings to known plants of to illustrations in other herbais, with results thar can only be

described as disappointingly vague and ambiguous. Elizabeth Friedman summarizes the most substantial of the identification

attempts as follows: 'Although a well-known American botanist. Dr. Hugh O Neill, believes that he has identified two

American plants in (he illustrations, no other scholar has corroborated this, all agreeing that none of the planes depicted is

indigenous to America. Sixteen plants, however, have been indisputably identified as European by the great Dutch botanist

Holm. The remainder are composite: i*e** the root system belongs to one plant, the stem system to another* the leaves and

flowers to still others. A few show imaginary root or flower structures*" (1962) Unfortunately* since Mrs. Friedman's article

appeared in a newspaper, there was no citation of the reference to Holms substantial discoveries; I have not* so far, been able

to turn up a published source for this information. Petersen appears to have obtained a detailed list of Holm's identifications

from some source, and noted many of them on his transcript. In spite of Mrs. Friedman's emphatic and convincing statement

of Holm's findings* later writers such as Tiltman (1968, 1975) do not seem to accept them as any more final than those of

O'Neill.

Many scholars seem to question O'Neills dramatic identification of the sunflower plant on folio 93 r

(1944, p, 126) 1 can

see good reasons* also* for questioning his "capsicum' or pepper-plant identification; the picture involved, on folio lOOr* is

among the small* sketchy drawings arranged in rows near to a pharmaceutical jar"* possibly representing a reape for an

herbal mixture. (For a discussion of these "pharmaceutical' drawings* see Section 3-3-2 below.) The objects O NeiJI sees as

pepper fruits could as easily be leaves, drawn according to the curious, blocky convention habitually adopted by the scribe of

the manuscript, to be discussed further below. This impression is supported by the fact that they are colored green, and not

red. The "pepper ' identification

was exploited by Brumbaugh in his decipherment; he suggests chat the coloring of the

pe pper" g r e en rather than red was a matter of deliberate concealment (1974* p. 546). Many students have taken a stab at

identifying the plant pictures; they are probably the most closely -studied drawings m the manuscript. The list of plant

identifications compiled by Petersen in his hand transcript includes identifications he attributes to Mr. and Mrs. Voynich.

O'Neill* and Holm (Petersen 1966)*

At this point* I would like to pursue a brief digression concerning the idiosyncrasies of style in many plant structures

shown to the herbal folios. For what they are worth. I will present my own subjective, and admittedly personal, reactions, in

the hope chat they may stimulate others to examine these drawings more closely and reach their own conclusions, The plant

parts frequently have a curious blocky, chunky, rough- hewn look* with platform-like structures surrounded by hard outlines

14

defining a sharp change of plane. To my eve. this characteristic convention causes some of the structures to appear as if they

had been molded out of plastic: see, for example, the root crowns in folios 44v, 45r, 45v, 3 7v, 27v, 23r, 9 r, 1 ir. 13r. 16 \.

and many others too numerous to list. They seem to be provided with one or several circular platforms, consisting of tubes or

inverted cones with flat, disk -like tops, from which the stems protrude, often encircled by a nag like a washer or gasket at

their point of emergence (see figures 5-7 for some typical details from these drawings).

An analogous structural peculiarity may be seen in the leaves of folios I5r 8 Sr, IOOr. 10iv2 (some of which are

pharmaceutical' rather than "herbal 1 ' drawings): they seem to end in similar platform -and -gasket-like swellings. In the

root structures of folios 3v. 22v, 45r, 45 v, 54v, 65r. and others, rubers are shown strung along the root

fibers in a similar

block v arrangement, like sea ions of pipe fined together. In folio 53r, they even seem rectangular, like a string of wooden

blocks (figures 5~7 show some examples of these forms). I cannot guess at the significance which may lie behind this perva-

sive element of style, but an understanding of it may well be important in interpreting the drawings and in tracing their origin

The same sryhstic convention is apparent in the "pipes," "tubes, 11 and cloudlike structures in the mysterious folios featuring

human figures (folios 75r and following) ,jo_ be, discussed more fully in 3*3.5 below,

A somewhat similar block v, rough appearance is seen in some herbal drawings in other manuscripts, that have been

copied over and over again from some much earlier source by successive scribes. This is the case, for example, in some early

Anglo* Saxon medical manuscripts based on the drawings of Dioscorides. Illustrations I have seen of some plant pictures in an

herbal artribured to Arnaidus of Vilianova, entitled "Traaatus de Virtutibus Her bar urn". have the same chunk v look as

some of :he Vovmch manuscript folios fcf also Tiltman 1968, figure 6). If, as this would imply, our herbal drawings are

copies ac many removes from some earlier source, we should still be able to recognize them by their general composition on

the page and their struaure (number of stems, fruits or flowers, rough shape of leaves and roots. etc.J. especially since, as

Tiltman pointed out (1968, p. II), the different sets of illustrations for early herbals were relative! v few and the same sets of

pictures were used again and again over many centuries by successive compilers,

I think, rather, that this angular quality is a feature of the scribe's personal srvle, and mav even have some symbolic

significance. It is executed quite boldly and uncompromisingly, and does not seem to be an unintentional result of ineptness

or clumsiness: the scribe definitely intended the plant parts to appear as he showed them. I offer the suggestion that the

draftsman of these pictures was more accustomed to, and interested in, making mechanical or structural sketches than in

illustrating natural objeas.

Another point should be raised here* concerning the presence of animals and human faces attached to or intertw ined with

the roots of some plants: for animals, see folios 25v, 49r; for faces, see 33r. 55v. 89rL Some root structures have the

appearance of animal or human bodies, with the main plant stem emerging where the neck would be: see folios 99 v, 90 vl,

89vl (lions,*), and 46v (a bird with spread wings: an eagle/). Some roots resemble the foot or feet of an animal, with claws

and toes (e,g,. 89rl). There are known parallels to this practice in a number of early herbals. Frequenrly. if a plant was

supposed to provide an antidote to or protenion from the bite of some venomous creature, the animal was shown under or

near the plane, almost as a mnemonic device to emphasize the association. The Vovmch manuscript examples may have a

similar purpose, except that in many cases the animal seems to be eating, hanging from, or burrowing in the plant much coo

happily to be a target for its ill effects. Perhaps the intent is horticultural, implying that the worm, bird. etc., is frequenrh

found with the plant, and feeds on it. Alternatively, and most probably (to mv mind), the meaning is purely symbolic, as is

common in alchemical manuscripts. (For examples of animal forms, sec figures 8 and 9.]

The faces attached to some plant roots (see 33r, 89rl). and the suggestions of eves, horns, snouts, etc., on other plant parts

(see 38r. 28r, and figure 9 for examples), are considerably harder to explain. Tiltman (1968) cites the examples of the

barnacle goose and the mandrake, well known to all students of early herbals. Some such personification of plants, or

mingling of plant and animal life into one form, may be involved in the Voynich manuscript. The plant may be considered to

engender or nourish an animal, or to possess some animal or human qualities like those imputed to the mandrake. In any

case, J would like to suggest that these two signal oddities — the curious sculptural modelling of plant parts, and the presence

of animal and human forms among plants parts — should receive more systematic study in comparison with similar praaices

in known herbal and alchemical manuscripts (an interesting parallel in an alchemical manuscript dated to the sixteenth

century will be noted in Section 8.8 below).

Another curious structural feature of many plant folios is the rigidly and mechanically symmetrical arrangement of plant

stems and leaves. For example, the stems rising from the root crowns in folios 5r, 22r, 35 v, 4Gr. and 90r2. and the

arrangement of the mam roots in folios 2r, Hr. 1 lv, I4r. 14v, 22v, 45 v. (and others) all exhibit a strange reentrant form,

crossing one another or twining together in a curious knot- like manner (see figures 5 and 7). Leaves are arranged on stems in

a rhythmically symmetrical pattern, for example in folios 3r, !3v, 22v. 29r. 4Lr, etc., which seems highly contrived and

Id

mechanical, in harmony wirh the architectonic quality exhibited elsewhere. This qualm is present even in the flowers or

'(rum that grow from these strange molded -plasuc " plants; the flower on tulio 00 v 1, for example, looks like a sei ut

metal spikes, rigidly fixed together; flowers in folios 3v. 6r. 56v. 90r2. and OOr look like the hoods ot vent-pipes rset ticure

6s, (Again. some striking parallels will be mentioned in the alchemical manuscript discussed m Section 8,6 k

3.3-2 Pharma cent tea 1 Dra wings.

The pages in this section of the manuscript show rows of small, sketchy plants or plant parts, which seem to emptusize one

structure — roots or leaves—ai the expense of the remainder. They are so abbreviated as to appear almost like mnemonic or

shorthand symbols referring to plants already illustrated more fully m ocher folios, or to plants otherwise familiar to the

scribe and his colleagues. A determined effort by several students to relate these sketches to the herbal drawings has not been

verv successful, however.

The other salient feature of these pages is the presence of objects that have been said to resemble pharmaceutical tars or

drug containers. On some folios (e.g., 99r and 1G2 v 2L the fars are 'labelled" with phrases or words in the Vovmch script,

unfortunately almost illegible in the photocopy at mv disposal because the pigment filling the body of the jars in mam cases

tends to obscure the writing. In other cases, a 'label" seems to appear near the jar which probably relates to u. or to the

recipe" it stands for. A similar "label" appears near each small plant sketch in the rows; it is hard to tell, in some cases

which of several neighboring plants is means by each 'label". One or more paragraphs of text are present between the rows

of pictures. The jar u usually at the left margin of each such row, irremtibJv suggesting that the plants tn that row were to be

used co make up the compound prescription symbolized by that jar. The design of the* pars is very ornate and florid, with

many fined cylindrical sections decorated by geometric designs, fanev cm hellish menu around the edges, curly feet, and

elaborate hnials or handles on the top (some of the latter resembling, to the irreverent modern eve, the central ornaments on

an automobile hoodk see figure 15. The ornamentation and the "pipe -section* "structure is similar m style to that of the

cans + from which some figures emerge on astrological folios (see below, 3 3 31 and to some of the fancy platform or pipe

structures in the folios featuring human figures isee 3*3-5 J.

3*33 Astrological and Astronomical Drawings,

Prominent among the drawings are a series of circular designs apparently clearly related to the months of the year. and

each provided with a central medallion showing a zodiac symbol A recognizable, if oddly-spelled. month name has been

written in what most students agree is a different and later hand than that of the Vovnich script. Figure 10 shows details of

these month names. The page for January and February (Aquarius and Capricorn 1 is missing, having been removed before

the manuscript was found by Voynich The srudent's first hope of gening anywhere through the known association with

months or zodiac signs is soon disappointed, since there is apparently little die in the diagrams that can be remotch

associated with conventional astrological diagrams and horoscopes.

Most of the diagrams have approximately thirty female figures shown around the periphery in one, two. or three rows

some of the figures are free-standing, while others appear to emerge from vertical or horizontal objects like cans or rubes

some of which are decorated with a variety of heraldic -looking devices. Some of the figures are nude, but others are partial! v

or fully clothed; the clothing visible on some of the figures includes veils, hats, crowns, and draperies of considerable

elaboration, which should be traceable to a particular place and time with a little research. A few of the figures, as noted by

Petersen on his hand transcripts, may well be male rather than female. A careful study of the apparently intentionally

distinctive designs on their "cans" may provide a due to identification of the beings, or permit crossmatching some of them

on different diagrams. Some of the 'cans" have crencllarions like castle battlements. Figure 1 1 shows an analysis of the

numbers of figures on the different rows in each diagram; these arrangements may correspond to some dassifi canon of the

days of the month important for medical practice; for example, the "Egyptian days" or "critical days".

The months of April and May with zodiac signs Aries and Taurus, stand out in contrast to the rest in that they each have

two circular medallions (folios 70vl. 7 lr. 7Lv. and 72r 1). and each has only fifteen figures, as if the two diagrams for the

same month were intended somehow to complement each other, an idea supported by the fact that the bull or ram is light -

colored in one case and dark-colored in the other. An amusing matter for iperial note is the fact that the animal in each case

is enjoymg a meal. Aries is dining with evident relish on the leaves of a small shrub, and Taurus is applying himself with

equal determination to the conrents of a son of manger or feed box carefully and realistically placed at his disposal. These

details, in my view, support a horticultural, medical, or agricultural context rather than a magical or mystical one (although

this can be anly an impression. Ac any rate. I find it a pleasing indication of the sen be s praematR and down-to-earth

approach 10 bis subject matter, whatever its meaning may one day prove to be

A number of other drawings in which the sun. moon, and stars are prominent! v featured mav be provisionally classified as

astronomical. J will attempt to present, in the following paragraphs, a sketch of the principal structural elements in each or

these, since it is impossible to reproduce most of them in this paper. Figure 12 provides a summary of the numbers of major

elements in these diagrams along with the 'cosmological*' diagrams to be discussed in the next section.

Folio Girl shows a central face, probably representing the moon, surrounded by a rwdve-poimed star; one side of each

rav is decorated with stars, the other filled in with solid pigment. In the continuation of the pair of segments containing each

raw single words or phrases in the Vovaith script alternate with groups of one or two small stars. Three concentric rings or

text surround the whole, with a decorative marker indicating what may be a starting position Folio 6 T v1 is baseo on a

somewhat similar plan, showing a widely -smiling sun face in the center of a system of seventeen double ravs. in which

phrases of text alternate with groups of from one to four small stars. A single outer ring of text is i nterspersed w ith decorative separators.

Folio 6lt2 is a complex circular design based on twelve-major divisions. In its center is an eight-pointed star, surrounded

by a ring of eight words. A dashed line indicates a starting point (.'I, Twelve moon faces, all facing to the right, occupy the

next ring outside the central area; each is accompanied by a text string. Twelve pie-shaped segments extend outward, one

from each of the twelve moon faces. Seven of these contain additional words, and all contain paragraphs of text Each

segment contains a phrase, apparently written in darker or heavier fashion, in its outer extremity A paragraph consisting ot

three hres, (of which the middle one appears to be in heavier ink), is seen beneath the circular design.

Folio 6Srl shows a roughly circular field of stars, with words or phrases in the Vovmch script written beside each Ac the

rop is a larger circular medallion with a sun face, surrounded by a ring of text: a similar, balancing circle containing a moon

face, also surrounded by text, appears at the bottom There are at least twenty -eight stars with labels tsome may have been

cut off in the photocopy). Some of the stars also seem Larger or differently-colored than others, a distinction which may have

some significance in the doctrine of the scribe. Folio 68r2 appears to show a related or companion diagram, again on a

circular field of stars; in this case, however, only the twenty-four stats in a central cluster are labelled. The sun face is ar the

bottom, the moon face at the top of the star field in this diagram. Attempts to cross-match the rings of text around sun and

moon, or the labels of individual stars on the two folios have so far been fruitless. Folio 68v 1 shows a central face, perhaps ^

sun. with a diadem or headband, surrounded by small flames or rays. A set of sixteen large double rays emerges from the

central face, one side dark and the other filled with small stars. This seems similar in form to folio 6"rl. and may be related

to it in the sun-moon pairing that seems to form a basic theme in the cosmological or alchemical doctrine involved in the

manuscript. The continuations of the rhirty-rwo separate segments containing the ravs contain alternate phrases of text and

fields of small stars. Two outer rings of text surround the whole, with starting positions indicated by vertical hnes

Folio 6Sv2 shows an eight -painted, sun-like center surrounded by eight petal-shaped ravs; bevond this are four segments

separated by four centrifugal lines of text. There is a further subdivision into eight segments, separated by four more

centrifugal text hnes emerging from the points of the central 'petals/' Four fields of small stars are interspersed among the

segments. A single text ring surrounds the whole, its starting point shown by a vertical line.

Finally, folio 68r3 displays a moon face within a system of eight major pie-shaped radiating segments containing four

alternating fields of small stars and centrifugal lines of text, separated by further subsidiary lines of text, in a plan similar to

that of 68 v2 just described. A single ring of text surrounds the periphery, in which no starting marker can be discerned.

It should be apparent that there is a systematic content of some sort in these diagrams. It may relate to contrasted hours of

night and day. times or events governed by different daises of stars, or effects of the sun and moon on the humors, elements,

seasons, ages of man. winds, directions, etc. (to name some of the entities that are grouped by 'fours' in medieval cosmoloev

and medicine) A group of seven small stars together in one segment of 68r3 las noted also by other students), could well

represent the Pleiades. Surely a careful and determined analysis of this wealth of structured content in conjunction with j

study of medieval doctrines should turn up something of use to us in interpreting the meaning of the diagrams.

5 3.4 Cosmological or Meteorological Drawings.

There remain many diagrams based on a fundamentally circular plan which show radiating segments, pipe-like or cell-like

elements, cloud and vapor dusters, and a central star-like or sun-like medallion. Text words and single letters are placed in or

written along many of the cells and rays, and in concentric circular bands around them, with starting points indicated, in

some cases, by vertical lines or decorative markers. Figure 12 shows a survey of the numbers of major elements m these and

the astronomical diagrams, lr seems likely that a systematic attempt to correlate numbers of related objects may turn up some

IT

1

interesting parallels among known medieval cosmological interns Number in itself had a magical significance in much

medieval and Renaissance philosophy, probably originating in Pythagorean doctrines. Medieval magical books often showed

elaborate parallel tables of "correspondences/' comprising lists of like- numbered things chat could be arranged in twos,

threes* fours* up to elevens and twelves. In th* Pythagorean philosophy of sacred or magical numerology* the numbers four,

seven* nine* and rwelve were considered especially important. Figure 14 show* some sets of elements extracted from tables in

Agrippa { 19701; figure 35 shows elements important in the Cabala (see Section 8.7), and figure 34 contains some parallel

lists of elements from Galenic medicine *

One very curious, and also (to my ere 1 very attractive diagram on folios 85-86r2 la portion of the recto of a Urge,

multiply folded page) shows a central sun face surrounded by four major segments. A line of text wirh a pair ot verticals

indicating a starting place runs around the central sun This is in turn surrounded by a sort of scalloped parapet, over which

four human figures may be seen; these figures seem clearly to represent a child* a boy* a man. and an oldster bent tor ward

over his cane. Over the head of each figure is a copious paragraph of teat The four main segments are separated by graceful

spouts of vapor that emerge beyond an outer circular border containing a nag of teat, and recurve gracefully back into the

segment to the left of their point of emergence. This drawing seems iikeiv to be related to the four seasons, the four ages of

man. the four humors* etc** as shown m figure 34; it appears that these associations might provide a point of attack into the

text within its four sections-

The general plan of the "four ages" diagram just described is highly reminiscent of a figure from an Anglo-Saxon

medical rainiiscrinc (Caius College* Cambridge* MS. 428* fo* 50* Grattan 1952* p. 941. The Anglo-Saxon diagram shows

four human figures holding jars from which four spouts fall toward the center of the circular medallion and divide rt into

four mam segments. A small central arde shows another human figure receiving the effects of these outpourings, within a

rmg of text in very dumsy and illiterate Latin* illegible to the illustration. An outer ring of text surrounding the whole

contains another Laboriously copied Latin sentence* Quartuor humores bishina partes liquores effundum tenet i per corpora

sic michrochosmi/' On either side of the four large figures are more Latin words* some illegible* which seem to refer to the

humors* properties, and elemenp Tcolera rubta* " "caUdiii," "sicca*" "sanguis*" "ealidm*" "humidus"; it* "Irigida."

"humida;' V'terra*" "frigida*" "sicca")* Figures of this sort are very common in medieval astrological and medical

manuscripts, and refer to the central doctrine of the 'microcosm" or "small world" of the human being, thought ro reflea or

recapitulate in numarure the elements and relations of the larger universe or " macrocosm." The usual form of such

diagrams shows i human figure with lines conneuing its parts with ocher words or pictures supposed to stand for forces

affecting them in the stars* weather* etc. (cfSaxl 1915 and 1927; & amp; ober 19481*

Another very remarkable diagram on folio 67 v 2 seems to stand in a class mil bv itself* unlike anything in ocher

manuscripts, It suggests a meteorological theme, based on four major divisions that may be the seasons. Four puffs of vapor

rush in from the four corners, half- concealing for. perhaps* giving birth to or supporting.') two suns and rwo moons

(Newbold interpreted one or more of these features as a "solar eclipse") A dotted line extends inward to the center from ihe

sun on the upper left perhaps indicating the starting point of the chronology or story* A sun wirh spiral rays inside a square

occupies the center* More vapor puffs squirt out centrifugal! v between the four outer ones* and Lines of text are written along

bands leading to both sets* Strangest of ail* the four outer corners are occupied by roughly circular arrangements of face -like,

balloon-shaped objects strung along pipes or bands to form simple* angular, geometric figures lan "X"\ a "4"\ etc.). One of

these forms* m the lower left corner of the page, shows four balloon-faces in a U-Uke arrangement opening at the top.

superimposed on a arde with three segments colored blue, green, and red; as we will see below* this tripartite circular figure

occurs elsewhere in the manuscript, and may represent a conventionalized map of the inhabited world

fT-diap")* The only

interpretation that suggests itself for these geometric figures is that of cruaal conjunctions of planets* or magical scar

figures, associated with the four seasons* directions* winds* ages of man. or other important events in the unguessable

doctrine beinp expounded in this enigmatic work. The stringing of circles or dots (although not faces) along lines in

geometrical arrangements is seen in Picamx (Ritter and Plessner 19621* where the intent is to show "star pictures or

constellations to be employed as magical characters I see 8.4). Somewhat similar characters made up of dots or circles soung

on lines are seen in alchemical manuscripts as well as m some magical alphabets (see 8.8 and 9*4. and figures 41 and 42 h

Another unique diagram* folio 57v. shows five concentric circles of text with a fiindv -indicated common scarring pome at

the upper left. In the center are four human figures* shown from the waist up; four bands of text radiate outward between

the figures from a central scalloped medallion, and four more text lines are disposed between che figures in such a way that

their raised hands seem to point at. grasp, or support these. The structure of eight bands of text in two groups of four each is

similar to chat of many other diagrams in che manuscript. This, too, is the diagram chat contains a sequence of seventeen

18

enigmatic symbol* repealed four times around the second of its concentric text rings. It is one of verv fe* cases of cyclically

repeating lists anywhere in the text, and has been subjected to much attention by students as a possible kev" uee figure 24*

Folio 68v3 is the drawing referred to by Newbold as a spiral nebula/' A central circle is divided by a horizontal line

through the center; the upper half ts again bisected by a line from top to center This plan resembles the scribbled geometric

figure in the center of folio 85-86v3 (for which see below). A word or phrase is written in each of the upper halves, and a

longer paragraph in the lower semicircle. A ring of text surrounds this figure, with a starting point shown by a marker Four

major outer segments are separated by gracefully-curving bands of text, within these are watery or wavy outlines, del mine

fields containing curving rows of stars on the same spiral plan. From the top center of each waw outline, four smaller curved

text bands spiral ourward. in the same plan of two sets of four elements we have seen so frequently in other diagrams. An

outer ring of text surrounds the whole, its start dearly marked by a decorative sign. This design, with its double-tour

structure, may also refer to the seasons, ages, humors, or the like. It may abo have a geographical

implication, since

the ^ symbol occurs elsewhere in medieval iconography as a form of symbolic map of the inhabited world.

Folio 7 Or I shows a six-pointed star with^*a. words of, text between its points It is surrounded by a curious ring of fifty-

eight tarefuilv-drawn cell-like objects, alternately empty and occupied by pairs of dots, and a ring of text. Nine wave* or

foam -like spouts emerge from a watery held surrounding the inner circle. Mine bands of text arc written radial l v outward

from the interstices of these waves. Three concentric rings of text surround the whole. There is little to aid us in

understanding this drawing other than a possible focus on water as an element or moisture as a propem, with their effects on

health, and the numbers six. nine, and fifty -eight.

Folio 69r also shows a central six-pointed star; five single characters and one digraph are placed between the points A

ring of text surrounds this central medallion. Beyond are fonv-five pipe -like, elongated ravs closelv packed together, with

heavier tines separating them into irregular groups of one. two, and three rays. Text lines are written radially along twenty -

one of these rays, and there is a ring o: text surrounding all. Folio 69v is somewhat similar, with a central eight -pointed star

having small stars between its points. Twenty -eight pi pc-like things emerge radially from the center, with a text word or

phrase written above the mouth of each as though issuing from it. Three rings of text run around (he outer periphery.

A small moon face occupies the central field of folio 85-86v4; five frothy or bubbly concentric rings of cells, scallops, or

waves run around the center The heads, arms, and shoulders of four human figures rise from the middle nog as from a sea.

Their arms are raised, and their hands are holding indistinguishable objects, one of which may be a cross. Four lines of text

surround the whole, with a clearly-shown starting point on the left

Folio 85-86v3 contains a very strange drawing dominated by four complex structures shaped rough l v like inverted cones

emerging from the corners of the page and extending inward toward the center. The upper left cone looks like a duster of

grapes, douds, or cells; from its tip. directed tow ard the center, a spurt of some substance issues, with the head and hand of a

human figure emerging from the duster beside it. The upper right structure is like a broad tube made up of scales or scallops

or waves in crosswise rows: from it a large gush of vapor or wind emerges toward the center, and within this a bird is flying

vigorously The rwo lower objects are more elongated in form and seem to be made up of la vers of longitudinal fibers with

interjecting crosswise rows of cells. One gives forth a large jet of specks like snow or rain aimed into the center of the page,

with a human figure half revealed as if peering around one side of the jet and flinging out a smaller jet of droplets with his

outstretched right hand. The remaining cone, in the lower right corner, emits no jets of vapor, but instead has a bird seated

on its apex, as if on a nest; bending over the seated bird are three branch -like structures on sulks. Four text paragraphs

occupy the four sides of the page between the large spouts, and a fifth paragraph is placed in the upper center.

It seems possible that the four jets may represent the Four Winds converging upon the earth, and that this diagram, like

several

others of this section, may be concerned with the seasons and the weather. The nesting bird, and the other, possibly

migrating, bird would be explicable within this frame of reference. A scribbled diagram of a circle with three subsections

©, like that in folio 68v3, occupies the otherwise empty center of the page; next to it and scrawled across it is a

disorderly scribbling that resembles ta re less! v -written Arabic script. This scribble is closely similar to another in the lower

left center of folio 66v. where it also seems to be associated with a rrudely- formed geometric figure. (See figure 21 for details

of these scribbled phrases,)

Finally, folio 70r2 shows a central face, probably a sun, surrounded by eight large segments containing petal-like rays. A

small ring of text runs around the center, and four more lines of text surround the whole. The outer lines appear to be in rwo

pairs: the outer pair has a common starting point indicated by a double vertical, while the inner pair has a different common

stan shown by a single vertical. A paragraph of text accompanies the design on the upper right corner of the page.

The above lengthy, but still very incomplete discussion of these interesting cosmological diagrams can by no means do

justice to the amount of information available in them for the student witling to accord to them the respect required for a

19

careful and mtemati c examination. I belitve ic has been tuo read it v assumed by mast students that the draw mo in the

Vovmch manuscript were too weird and nonsensical to warrant this attention. The research must await the efforts or

parallels that could provide an understanding of the teat,

3. Jp3 Drawings F Maturing Human Figures,

The drawings on folios 75 r and v and "*6v through 8-iv are probable the most mysterious and bizarre of all the mam

enigmas with which the Vovnich manuscript confronts us. They show sequences of human figures, almost msurubh nude

and female, and las has been very frequently and somewhat arthly noted by other students > quite plump and marnmly in

form. Most of them have distended abdomens and bulging hips: thev certain! v do not present an appearance ot voluptuous

beauty to the modern American eve. The impression is rather one of agricultural fertility, maternal fecund in and

nourishment, or something on a similar pragmatic plane. Many of the figures seem to have long hair, crowns, or elaborate

veils in spire of their otherwise complete lack of clothing. Their poses are iiveiv. expressive, and varied

The female figures are shown variously sitting, standing, king, or otherwise disposed in or on curious objects like tubs,

tubes, pipes, eo? I -scuttles, puipiu. pods, or platforms. These obi ecu are drawn in the same chunks, blockv stvJe nt

architectonic sol iitv as was noted above in connection with the plants. In fact, some of them look quite a lot like the fruits,

seed pods, and root or stem structures of these very plant drawings. Note, for example, the two striking spherical objects,

somewhat resembling mines or bombs trailing fuses, crossed on folio 83v, to mv eve. they close! v resemble the twin fruits > r •

on the plant in folio 90r 1. A structure on folio 79v of three pipes surrounding a larger central tube resembles the root crown

of the same plant on folio 90rl. Similarly, a tripartite structure on folio 77v made up of three nest- or pulpit-like swellings

connected by pipes, with three tuber -like objects hanging from the central swelling, looks to me like the root crown of a plant

with three main stems connected by underground roots or stolons (see figure 15 for examples I.

Some of the female figures seem to be holding spindle-shaped objects that could be fruits or seed pods. The pipe-like

structures that coil around the figures (and into which, or from which, they appear to be transmitting some mysterious vapor

or liquid) could well represent plant para such as roots or stems in schematic form. Abo to be remarked upon are cloud -like

dusters, puffs and sprays of vapor emerging from the numerous vents of these pipes, and the substantial -looking tubs of

liquid in which groups of female figures seem to be sitting, standing, or moving about. Some form of

humor, essence,

moisture, or sap seems to be of primary importance in the doctrine expressed by these pictures. In some folios le.g.. ~5r. to

the left of a descending line of figures: 82v. at top right and also two more below, center), arc -Like structures seem to span

openings in some of the little scenes These look a great deal like rainbows, although without seeing the original colors one

can only guess: most of the arcs seem to have four or five separate concentric segments with a darker band at the top. i For a

discussion of an alchemical drawing containing a pipe with multiple vents emitting vapor, in a sryle similar to the pipes on

these folios, see Section 8.8).

Another important detail to be noted in several of the drawings of this section is a small cross with one long arm ifcr

example, at the top of folio 75 r. serving as a focus for diverging rays: on 75 v to the right within a field of ravs and douds; on

7gr at the focus of a grape- or cloud -like duster at upper left; and on 79v, top, at the focus of a fnUv canopv of ravs over the

head of a figure who also holds a cross in her hand). These symbols are quite small and unobtrusive, but usually seem id

form a central focus or origin for rays descending upon the female figures. The obvious interpretation is one of Dr vine

illumination or influence promoting the fecundating, nourishing, or healing vinues of the humors controlled by. or

represented by rhe female figures. The crosses provide an unmistakably Christian frame of reference for the doctrine bem£

expounded by the scribe of the manuscript — a point not specifically remarked upon by other students to my knowledge.

Whit are we to make of these strange drawings/ A possibility that immediately occurs to me is that thev may relate the

doctrines of Galenic humoral medicine, with its four "digestions" and various byproducts at different stages, to the

nourishing or curative properties of the plants or prescriptions of the herbal and pharmaceutical folios. Another possibility is

a system of therapeutic baths; this was a common feature of medieval medicine: warmth and moisture were supposed to be.

in themselves, healing forces. It is amusing to note in this connection that Roger Bacon, an his medical work De Retardation*

Accidentum Senecturis (Bacon 192Ba), recommends perfumed oils, warm effusions, and the application of precious

occulta' such as lign-aioes, "heart bone of a stag." and viper s flesh. (This medical work was a competent and complete

compilation of earlier medical sources such as Galen. Pseudo- Aristotle, and numerous Arabic writers, and was plagiariaed

and exploited by later physicians; little in it. however, was original with Bacon.)

Brumbaugh (1975 i has seen in these pictures a recipe for the 'Elixir of Life/' designed to look like Roeer Batons *ork

i Bacon's medical treatise, his work entitled BpsstoU de Mtrabilt Potestate Artis et Naturae, and some garbled or doubtful

versions of bs alchemical writings were the only fragments of his writings well-known in the sixteenth century] Panofsk v

f 1 954, p. n, suggests that the human figures may represent "astral spirits" transmitting the influences radiated from the

stars into plants and other living things. Singer, in his Letter to TiUman. 12 November 1957, puts forward a different,

though related, suggestion: "Mv own feeling — again very vague — about the little figures of nude men and women m the

organs of the body is that they are somehow connected with the 'archaei" of the Faraceisan or Spagvric School. This would

fit in well with mv suggestion about John Dee and Bohemia." Note that Singer sees the tubes, pulpits, and pipes in which the

figures sit as "organs of the body, rather than as the plant parts they recall to me. Figure 1 3 shows an analysis of the

numbers and grouping of female and male figures on the folios of this section.

3.3.6 Network of Rosette s t Folios 85-86ri~4 t vl-2.

This elaborate am v of circular medallions coven severai-segmena of a Large, multi ply-folded page. It has received Little or

no study or mention by students: this may be partly because us complexity and bizarre character boggles the mmd ahead v

overburdened by the "queerness" to the modern eve of so much else in the manuscript. The failure of some students to p^*

much attention to these designs is also probably due to the poor quality of the photocopy available to us for these pages The

photocopy made from Father Petersen's original copv is so dark, and the numerous scraps of text wnrren here are there are mi

hard to read, that it is almost unusable,

A phorostatic copy which I recently obtained from the Beinecke Library reveals the details of this remarkable draw me

very dearly There are nine elaborate circular designs, m three rows of three each. The central design in the middle row is

larger than the others, and contains six pharmaceutical "jars" arranged in an oval pattern with stars in the center. Between

the medallions are veils of cell-like or fibrous structures that link each cirde to its immediate neighbors. One medallion

shows a structure like a castle and other small buildings around its periphery; the castle has a high, crenellated wall and a

call central tower. The center of this figure contains a circular field of stars and a spiral arrangement of text. Nearby, m the

outer corner of the page, is a smalt cirde containing a © diagram with Voymdi text "words" within its segments. In the

opposite corner of the page is the small "clock-face" mentioned by Brumbaugh i about which more will be said below i In

the other two corners are sun faces surrounded by wavy ravs. Some of the medallions have petal-like arrangements of ruvs

filled with stars, recalling features of the cosmological and astronomical folios discussed previously. Many medallions are

provided with curious structures like bundles of pipes or gunbarrels clustered around the periphery of their outer circular

outlines. This complex assemblage of symbols deserves far more attention than it has so far received, in my opinion, since it

could provide some enlightening synthesis or frame of reference for individual diagrams elsewhere in the manuscript.

A mention should be made here of Brumbaugh's identification of a "clock face" among these diagrams. There is a tin*

circle, surrounded by eight!/} designs vaguely resembling Roman numerals, and what may be a small nng of text, on the

extreme left side of the structure. In the center of this circle is a triangular arrangement of two intersecting lines with three

small spheres strung on them, at their free ends and at their intersection. While it is true that this circular design bears some

superficial resemblance to a clock face, it seems possible to me that it may also represent a star picture like those of

and the similar alchemical characters mentioned above Section 3 *3.4. The two "hands" look to me as if they are intended to

be of equal length, and the hands" are not centered on the "clock face" as one would expea. but rather arranged so that the

entire triangular structure is centered in the circle. An exactly similar triangular symbol with three balls strung on it occurs

frequently among the star spells of Picamx . and was used by alchemists io mean arsenic, orpiment. or posusb (German

1922. Tables IV. XXXXHL XXXXVh

3-3*7 Small Marginal Designs.

There are small drawings of people. ammaLs, and other less easily -identifiable objects on some pages. Folio 66r. as has

already been noted, contains a drawing of a man lying on his back clutching his stomach as if sick or dead, and surrounded

by various indeterminate small objects. The Last pge. 116v. has several sketches of people, animals, and other mysterious

shapes in its upper left corner. Most of the pages filled with text (folios 103 and following) have single stars, some provided

with extensions like tads, to the left of each paragraph. These paragraphs, as has been pointed out by Tilcman \setminus 197 V

probably comprised approximately 365 originally, thereby providing one "star reape' " for each day of the year, possibly a se*

21

3-4 Meaning of the Collection of Drawings as a Whole

Voynich stated his impression on fine seeing the manuscript, that 'the drawing] indicated it to be an encyclopedia work on

natural philosophy' (1921, p. I). Eliiebech Friedman says: 'The 'botanical' and largest section of the manuscript (125

pages) is probably herbaLutk in character, and the manuscript may constitute what is now called a pharmacopeia" (1962).

Panofsky provides another dear summary: "So far as can be made out before the manuscript has been decoded, its content

would comprise: first, a general cosmological philosophy explaining the medical properties of terrestrial objects, parotularly

plants, by celestial influences transmitted by astral radiation and those spirits' which were frequently believed to transmit the

occult powers of the stars to the earth; second, a kind of herbal describing the individual plants used for medicinal and

conceivably, magical purposes, third, a description of such compounds as may be produced by combining individual plants in

various ways" (1954, p 1). He confesses that he is unable to suggest any known medieval parallel synthesizing all ot these

doctrines into one compact book. (There were, in fact, a number of very large encyclopedic works of many volumes that

covered a somewhat similar range of toptn: an obvious example that comes to mind is the work of Albertus Magnus, a

contemporary of Roger Bacon.)

Petersen provides a similar view of the manuscript as a whole: The illustrations in the manuscript make it appear ail hut

certain that the text deals with medicinal plants and their use in medieval remedies. The drawings of folios 67-86 seem to

illustrate astrological matters, and possibly the medieval theory of vital spirits functioning as animate beings (represented by

small nude figures)' Might not the 324 separate short paragraphs or sentences (folios 103-1161 contain a sort of

subject index or table of contents or list of recipes/" 1 1953. p- 1) Brumbaugh sees the manuscript as a treatise on the "Elixir

of Life ", designed to interest the Emperor Rudolph 11 by a forger who wished to make it appear to be the work of Roger

Bacon. An 'encydopedic sequence of drugs", possibly compiled from a variety of earlier manuscripts, is followed by

astrological lore; the folios featuring nude female figures may deal. Brumbaugh chinks, with "the biology of reproduction,

the theology of psychic reincarnation, or the topical application of the elixir". (1975. pp, 348-349).

In studying the dnwings in the different sections of the manuscript, I have come to feel strongly that they involve a high I ν

symbolic, artificial, and conventionalized graphic or mnemonic "language" that uses the same representations or forms to

call to mind particular key concepts on different folios and in various combinations with one another. This graphic

"alphabet" or ihorthand seems in man? wavs closely similar in its philosophy to the -interesting structure of the Vovmch

script (to be dealt with in Chapter 4). For this reason, I believe thiE a careful, painstaking, and open-minded analysts of all

the drawings and their component graphic elements, indexing and cross- matching all the forms, might repay the effort

involved. An experiment using modern computer CRT terminals with graphics capabilities so perform such analysis would be

worthwhile, if earned out within a carefully -reasoned theoretical framework (ue.. to pursue and investigate particular

theories previously developed by the student concerning meaningful relations among the forms!. More will be said in Section

6 9 regarding the use of computer techniques tn studying the manuscript.

Chapter 4

Avenues of Attack: The Text

4.1 Nature and Characteristics of the Voynich Script

However complex and interesting the drawing! are. the script in which the bulk of the manuscript is written is

undoubtedly the most intriguing pan of the elegant enigma. It has a deceptively flowing, rhvthmic quaitty that suggests long

practice and familiarity on the pan of the scribe or scribes. The script seems like a reasonable, workable, well-constructed

system of writing, with a Kook of ease and natural flow. On closer inspection, the surface appearance of simplicity vanishes,

and a still more seductive and- captivating charaaer. emerges^ in the form of an intricate but structurally logical system of

ligaturing or compounding of simple forms to build up more complex outlines. Whatever else may be alleged concerning the

value of the manuscript as a whole to science. [am convinced that an understanding of the construction of this writing system

cannot fail to be of great interest in the study of human thought. It appears to be a tour de force of artistry and ingenuity

4* LI Provenience and Style.

Unfortunately, although many students mention the style, calligraphy, and appearance of the script as a factor in their

judgements of the date and origin of the manuscript, they provide linie real evidence or detail to back up their claims

Nowhere among the sources I have examined have I seen any really factual or complete discussion of the matter Some

sources mention, in passing, the possible derivation of the Voynich symbols from "Roman minuscule characters.' McKaig

in.d.) states that "the text is written in a beautifully symmetrical script that slightly resembles writing used in Italy in the

1 500 V (p. 48).'

4. L2 Relationships to Knoum Scripts and Character Sets.

Attempts to link fhe origin of the Voynich symbols to other systems of writing have been many and farranging. A diligent

study of known alphabetic, syllabic, or ideographic scripts has turned up nothing remotely similar, though various individual

symbols have distant parallels in some compendia. Several symbols resemble early forms of Arabic numerals: this has been

pointed out by more than one student of the manuscript, for example, by A. W. Exell (of the Botanical Library. British

Natural History Museum), in a letter to Tiltman. 30 August 1957, and by Robert Brumbaugh (1974. 1975 k Figure 16

shows a comparison of some Voynich symbols and various forms of early Arabic numerals extracted from tables in Hill

f 1915) that look similar in my opinion. (See also Secrion 8 JO for a discussion of the history of Arabic numerals in Europe J

Some form of substitution cipher may be involved, of course; thus, the fact that a given Vovnich symbol looks like an early

form of "7" or "4". for example, need not imply that it actually stands for that number in the text. Early forms of Arabic

numerals were often employed in a wide variety of codes and ciphers, as we will see in Chapter 9

Similarities are also clearly apparent between some Voynich symbols and certain Latin abbreviations in use at various

limes during the Middle Ages. These relationships have been investigated and exploited by several students, notably Petersen

and Feelv. Figure 17 shows a selection of Latin abbreviations

extracted from Cappelli (1949) and some Vovnich symbols

that resemble them in my opinion. A general similarity was apparent to me. and was also noted, independently and earlier,

by Tiltman. between certain commonly -occurring looped symbols standing above the line and the decorative extensions of

letters with tall stems in the top line of a manuscript illustrated in Cappelli (Table IV h Some artificial writing sysrems of

various kinds that might throw some light on the Voynich script will be discussed in Chapter 9

4. L 3 Attempts to Decompose the Symbols into Elements.

It has been concluded by most students that the Voynich script includes at least some compound

symbols. Various attempts

have been made to arrive at a rationale to explain the ligatures and resolve them consistently into component elements. Some

students have proposed that the symbols may have been built up from elementary strokes in a manner similar to the method

upon which they supposed that the Chinese writing system was based. Tiltman suggested th?t missionaries visiting the Far

East, who had studied the Chinese system, might have brought back a description of it which then might have inspired some

fifteenth- or sixteenth -century scholar ro design the Voynich script (unpublished notes) A. W Exell, in hts letter to

23

Tillman. 50 August 19V* refers to a theory (not further specified j that early Arabic numerals were built up trom ont. rwo

three, four or more strokes in a similar Oriental manner: he suggests a sketch \ and incomplete correspondence between

Vovnich symbols and conventional numerals along these lines. No one has* to my knowledge, worked out a stroke theory

of this kind in sufficient detail to test it out as a hypothesis.

In this connection, it is interesting to note that Roger Bacon provided extensive information concerning the Far East in a

highly interesting section of the Opus Maps on geography and the customs of foreign peoples* He states there that he had

closely questioned several missionaries and travellers recently returned from visits to these far-away places His descriptions or

many foreign peoples and customs are clearly recognizable, although some are fabulous and distorted, as might be expected

A dear description of Buddhist monks at worship, even including a garbled version of Om mane pad me hum is

particular l v striking The following is his description of writing in China The people in Carhav to the cast write with the

same instrument with which punters palm, forming in one character groups of letters* each group representing a sentence $B\setminus$

this method characters are formed with many letters together, whence reasonable and natural characters have been composed

of letters, and have the meaning of sentences." (Bacon 1928b. p. 389.1

The compound Vovnich symbols are not easy to "uke apart' in am consistent and unambiguous wav: ibe\ are ton

smoothly blended to form a single flowing outline. Figure 18 shows some examples of apparently compound forms, and some

suggestions regarding their decomposition. Some symbols which appear to be simple at first sight mav in fan also be

compounds: for example. may be made up of r L and *\ and may be a combination ot ^ .me

^ Mv own feeling is chat we need not go as far afield as the Orient to explain these complex outlines: the sutem or

Latin abbreviations to common use throught the Middle Ages has the same character. An abbreviated lurm typiialh

preserves one or two letters of a word and distorts or combines them to form a single sinuous, conventionalized character

Some of the parts of such a compound form may then be pamaJlv disconnected and used in abbreviations oi other, partialh

similar words. The distorted and truncated scrips of words are usually combined with over lines, supertixed characters, loops,

tails* and slant Lines which mark the form as an abbreviation* or stand for a set of missing letters Each of these structural

features has a counterpart in the Voynich script: a horizontal stroke seems to connect many symbols: a comma* or hook -like

mark often appears above certain symbob, and characters are frequently shown standing above or in the midst of others as

infixes or superfixes; long tails curve up or slant down from letters at the ends of words and lines.

It is my feeling that we need not look beyond the system of Latin abbreviations, familiar to all learned men of the Middle

Ages and Renaissance throughout Europe, combined with early forms of Arabic numerals and some common alchemical and

astrological symbob* to find the inspiration for the design of the Vovnich script Unfortunately for the student, the designer

has exhibited a truly remarkable ingenuity in blending and distorting these elements so as to make of them an entirely new

writing sysiem* fundamentally independent of and distinct from any of its sources, so that our recognition of similarities rt»

known symbols has not helped us to unlock the secret of the script. It is interesting to note that the characters which occur as

superfixes or infixes with other ligatured characters may also occur next to them in ordinary sequence: the explicit and care*

fuJIv shown ligature must, therefore* provide some distinct element of meaning. (For example, is C"E' the same as 0 C f

How does vr differ from " « V Is " 5ft equivalent to Tf cr m crV or neither.')

Most crvptanalvnca 11 y -oriented students of the manuscript have put considerable effort into analyzing the script and

attempting to devise a working transcription alphabet for use in crvpunalvuc and computer studies. Various researchers have

adopted different theories regarding the decomposition of the symbols into elements* and the identification of variant for ms

of a single symbol* Some* Uke Tiltman and the First Voynich Study Group* arrived ai a relatively small working alphabet ot

basic symbols, regarding all the rest as secondary compounds. At the other extreme* Currier* Krischer* and the Second Srudy

Group included a number of obvious compounds m their working alphabet to produce a considerably longer list of symbols

Currier's alphabet and the others based on it embody a theory about the symbol "k" and its occurrence in groupings of one,

two. or three immediately preceding certain ending symbols ' and own transcription alphabet

includes an attempt to allow for some relatively rare ligatured elements in addition to those in the commoner compounds

Figure 1 9 shows several different transcription alphabets.

4-L4 Variant and Embellished Forms of Symbols.

While all have agreed that a relationship of some sort exists among certain families of similarly -shaped symbols, students

have associated them differently depending on their theories regarding the exact nature of the kinships (see figure 19i.

Considerable interest has centered on the four looped symbols" $^{\land}$ M t ff * * -4 $^{\land}$ "that are all found as infixes or

superfixes over the symbol 'CT" as well as alone. An interesting bit of evidence for the identity of and '* ^ (and

thus, by analogy* the ocher pair T and as wellL may be seen on folio 57r* where a sequence of seventeen symbols is

24

repeated four times around a circular band. It is so rare to find any sequence in the Voynich manuscript repeating all nr some

portion of itself that this example is almost unique. Figure 24 shows the tour repeated segments arranged in parallel, in two

instances, the symbol "with only one loop, occurs in the ninth place, while in the other two. we see " "with two

clear loops in the corresponding position. Since all the other symbols appear identical, the conclusion seems inescapable that

the single- and double -looped forms art functionally the same. Countervailing against this conclusion is the tact thu the

symbols are always made quite clear lv and distinctly, with either one or two loops; there are rareiv if ever any transitional or

marginal forms with vestigial or careless! v- formed loops. In any case, there is an obvious family relationship of some kind

among the four looped symbols, as shown by their similarity of form, their entering into similar constructions. Jnd their

assuming a similar function and positions in the structure of text words.

Embellishments are relatively few m the Vovnich rest. Figure 20 show s some variant and decorative forms of symbols

various students have tentatively identified them; many of the assumed identifications arc mv own opinions. Some ot the

decorative extensions and flourishes are quire attractive in a bizarre and idiosyncratic way. Smalt dots inside loops, parallel

hatching along lines, don arranged tn rows .-and exaggeration or. prolongation of loops are frequent ornamental devices The

embellishments are. for the most part, highly resttained. and not at all the extravagant, disorderly overgrowth one michr

ex pea of a deranged mind. It should be noted also that the ornamental extensions rareiv. if ever, impinge on or threriere

with writing or drawings nearby, and that it is rare in general for writing or drawings to cross one another any where in the

text, except in a controlled and orderly manner

The curious embellishments appear to exhibit the same rhythmic, pragmatic, and compact character as is evident m other

aspens of style throughout the manuscript. A particularly notable and amusing decorative flourish is the apparem

disconnecting of the two loops of the character " Jf ", so that one stem and loop is translated horizontally into a

neighboring word, sometimes with several intervening curlicues: figure 20 provides a number of examples. It is possible that,

in some cases, the intent may be to combine two separate occurrences of " 'into one decorative flourish, there may also

be some element of meaning in the practice, although it is scarcely frequent enough, especially in lines ocher than initial lines

of paragraphs, to support such a conclusion.

4.2 Other Scripts. and Hands

On certain pages of the manuscript are found isolated phrases and sentences in scripts and bands judged by most students to

be different from, and probably later than, the bulk of the text (although none of the sources I have studied present Jn

definitive evidence supporting a different date or authorship for these scattered text strings) Petersen reports that Miss Nil)

(a friend of Mrs. Vovnich) had made a thorough examination of all the apparently extraneous passages tn the manuscript

Miss Nill . has listed all words or passages which appear to be wruten rr different ink from char used uniformly for the

text and the drawings throughout the manuscript. (She noted also that the original text seems to show not a single erasure

and correction anywhere,) Miss Nill declares that the last page is written to the same ink as the bulk of the manuscript

H953. p, I), Unfortunately, no copy of Miss Nill* list has survived m the material to which 1 have access I offer the

following summary from mv own examination of the photocopy available to me.

Folio lr. There are very faint and barely legible traces of alphabetic sequences in the left and right margins These are not

visible ai all in the photocopy 1 have studied, but Petersen shows them clearly m his hand transcript.

The letters seem to bt

those of the ordinary ABC ", with some slightly distorted or odd forms. The two sequences appear to be parallel, in their

fragmentary state, it is hard to tell whether they are consistently associated with the lines of Vovnich text occupying the center of the page.

Folio 1 7 r. A line of writing in a very small, crabbed hand crosses the top center of the page. It is very hard to make out; to

my eye. the letters resemble Greek symbols. The writing becomes fainter and harder to read toward the right side and finalK

fades out completely. In the upper right corner, there is a faint, scribbled symbol like a shield or a crude fleur dr lys. criss-

crossed with lines. It is interesting to note that John Dee liked to use Greek letters to conceal comments in English in his

personal diary; the symbofs on this page, however, do not seem to spell anything that might be an English word

Folio 66r. A small scattering of letters, which again look to me like Greek symbois. arc to be found in the lower left

corner of the page near a small picture of a man lying on his back. Above the "Greek" letters is a string of words in the

Vovnich script. Prof. Richard Salomon of Kenvon College has suggested a High German interpretation of the extraneous

symbois, claiming that they stand for "der musz del", or the mussteil', referring to an obligatory bequest of household -

goods from a man to his widow'.

Folio 66 v. In the lower half of this page (which shows a plant drawing accompanied by three text paragraphs; there is a

scribble or doodle that slants downward toward the left. A rough oblong figure sits to the right and above the scrawl. The

markings here resemble a similar scribble in the center of folio 85-S6v3 fsee below some pontons of the doodle have the

appearance of Arabic script.

Folio 85-S6v3. In the center of this cosmological diagram there is another doodle similar to that in folio 66 v, A crude

circle is bisected by a horizontal line, and the upper half bisected again by a perpendicular; a line of indecipherable scribbling

something like Arabic script crosses part of this circle and extends to the left of it.

Folio 87 r. To the left of the lower leaves of the plant drawing is a crude star-like doodle of inversecong lines

Folio 1 16v. The several lines of text in a mixture of symbols on the last page of the manuscript have been extensive! v

studied br many researchers as a possible 'key" to the text. Figure 23 shows several transcriptions of

this material made by

different students along with a reproduction (admittedly poor! of the photocopy at my disposal. The symbols are very small

crabbed, and faint. It is interesting to note the differences among different students' interpretation of these enigmatic lines.

The numerous ambiguities and obscurities have nor prevented several students from basing extensive theories on their own

rather arbitrary readings of the tiny, distorted letters.

Folio gatherings. In the lower corners of certain pages are numbers added in what appears to be a different ink and hand

These numbers correspond roughly to sets of eight pages. Those discernible in the photocop v I have studied are shown m

figure 22. with the page number associated with each. The numerals are interesting in themselves, exhibiting some archaic

forms; they art accompanied by symbols for Latin abbreviations, one of which, ^ " for *us exact! v resembles j

common fymbol in the Voynich script.

Folio numbering. At some point during the eventful history of this manuscript, someone added numbers m the upper right

hand corner of the pages. These numbers agree with the present order of the pages, and show gaps where certain pages have

apparently been lost since the numbering was done but before the finding of the manuscript by Voynich. Some students have

dated the folio numbers to the sixteenth or seventeenth century; they may well have been added by someone at Rudolph s

court. The forms of the numbers do not differ significantly from modern forms.

Month names in astrological diagrams. The name of a month has been written into the central medallion of each circular

diagram associated with a recognizable zodiac sign. These month names are considered by most students to be written m a

different ink and hand than that of the main text. Figure "10 shows details of these medallions and month names. A single

word in the Vovnich script is seen next to the two scaly fishes of the Pisces medallion (folio 70r21; attempts to identify this

word with the month name or zodiac sign have so far been fruitless. No one has made any progress, or even, apparently, any

determined attempt, to idendfy the language or provenience of the month names, despite the fan that they are among the

few clearly recognizable and comprehensible bits of text in the entire manuscript.

43 Linear Sequences that Look Like "Keys"

Several pages of the manuscript are provided with columns or circles of single symbols or short words that seem ro be

arranged in some sequence that may be an index or key. Brumbaugh has exploited these sequences extensively in his theory

of decipherment (set Section 5,4); according to him, the multiplicity of "keys", although associated with a deliberate

attempt at mystification on the pan of the scribe, still provide some valid and useful information about the cipher. Below u a

list of these, insofar as I can identify them; some of the "key" sequences are also mentioned above under Section 4,2.

Folio Ir. The two parallel alphabetic sequences in the left and right margins, described above, have been thought to

function as keys; a suspicion enters mv mind, however, that they are the result of some larcr would-be decipherer s workings

It is surprising, considering the number of people who must have attempted to read the manuscript at Rudolph's court and

elsewhere, that there are not far more doodled numbers, letters, and lines on its pages.

Folio 49v A clearly discernible verticil list of twemy-six Voynich symbols runs down the left margin of the text

accompanying a particularly decorative "herbal' folio showing a cyclamen-like plant. Figure 24 shows this sequence, which

exhibits a partial repetition in three cycles.

Folio 57 v, Seventeen symbols, some quite complex or unusual in form, are repeated four times around the second

concentric circle from the outside in a cosmological diagram. The four sequences are shown in parallel in figure 24 This is a

rare instance of sequences repeating almost exactly in the manuscript; in fra. I believe it is the only such instance.

Folio 66r, In the left margin is a rather complex sequence of single symbols associated with isolated short words and the

lines of a text paragraph, all in the Voynich script. Brumbaugh employed these sequences ai "equations " expressing a

correspondence between the letters and the words (see 5 4 below). As is frequently the case in this manuscript, however, the

26

horizontal association of the scattered letters and single words is not very accurate , and neither is clear! v and consi stench

related to the lines of the paragraph.

Folio 69r. Between the points of a central star are six Voynich symbols.

Folio 76r. A string of nine Voynich symbols is seen in the upper left margin, spaced out vertically in rough association

with certain lines of a text paragraph.

To my knowledge, no one other chan Brumbaugh has directed much attention to these sequences. No consistent alphabetic

or numeric order can be traced from one to the next. They may be conventional abbreviations standing for sequences of ideas

or objects known to the scribe or scribes. Their presence as a salient feature of the text indicates that the writing system was

capable of employing single symbols or pairs of symbols to stand for some sets of concepts. See figure 24 for examples of

many of these "key ' sequences

4-4 Cryptanalytic and Stylistic Attacks on the Text

Students who have approached the Voynich text from the point of view of the professional cryptanalyst have been Led on

at first by a deceptive surface appearance of simplicity* only to bog down sooner or later in an exasperating quagmire of

paradoxes and enigmas that reveal themselves one by one as analysis proceeds. Eltzeberh Friedman has provided a dear

conose %ummary of the frustrations awaiting the crypcanaivse in the Vovnich manuscript. I cannot improve on the darit\

compleumess. and succinctness of her remarks, and so will quote them at length in the following paragraphs.

"WtaE ii ftfieriliv ihr inuiat rnenon of a professional cipher expert to ihr manuicnpt' At first ebnee it looks m thouch it jhuuid he

*erv c*iy tv >olve. became ih* "ait item* to be in word tenrth* and word repetmons «ar*d our ckarb on practical h every pace

A single frequent* table mould be made at once of a portion of text . just as Foe did in the Gold Buj; Bur to do that neinutjrev

deciding brw manr different itmboli there are m the manuscript, and this it neither simple nor easy. For what teems it first ebnee to be j

single umbol often appears to be a composite made up of perhaps fwo or three symbols

If a frequence table is made lor a piece of ten amounting to about 500 consecutive words" twhirh come to about 1500 chiranem. it

presents the character tin r rouph appearance of a frequence table for a simple substitution cipher A few symbols have a yetv hik'h

frequency; a few hive i verv low frequency; the rest are of varying but medium frequencies. Beude the many repetitions of single words

there are also mint repeated sequences of two. three, ur more words

The first impression, cherefiae. n that here is a simple substitution Cipher, However, the decipherer is doomed to Liter irultftiti'wi when

no solution based on inch a theitry is reached Trials in Latin. Greek. German. Italian, etc . vield nothing at all. So maihe it s nut vimpu substitution.

"Bur then the possibility of transposition, of combined substitution -transposition . or of multiple alphabet substitution art also ruled out

for the reason that there is entirely too much repetition. We find thousands of repetitions ol three-, tour- and five-letter witrti*

throughout the text.

For example, in nineteen lines of teat. a. certain three -character group appears nxrv*si* times And in regard to repetition of complete

words . the whole manuscript is quite homogeneous, the "words in all sections are very much alike

'Indeed, sometimes, and nut too rtrely, one finds the same word" appearing three times in succession, producing lomrthing similar t»

Gertrude Stem s A rote is a ruse is a rote, , ." Also, there are thousands of cases m which, two words of four, five, or more characters

differ from each other byonly «ie character. as in English, the words strike and stroke. wore and stork 1062 |

There have been several attempts to anal vie the Voynich texr using computers Unfortunately. for a variety of reasons.

Iirric progress has resulted from these efforts, with the sole exception (to mv knowledge) of the researches of Prescott Currier

(see Section 6.8). Cryptanalytic studies have included monographic, digraphic, and trigraphic frequency counts throughout

samples of vinous sizes, based on several different transcription alphabets. Reverse alphabetic sorts have been made to srudy

endings of words, and word indexes have provided an analysis of different occurrences of the same word and a

comparison of their contexts. The difficulties of arriving at an alphabet, transcribing a sufficiently large wimple of text, and

gaming access to enough computer time have hampered students in their efforts over the vears. Most of the proposed

computer srudi es were never earned far enough to result in any solid gain in knowledge. More will be said in Chapter 6

regarding certain specific computer studies and some methodological considerations relating to the use of computers in general.

While relatively few have had access to computers, many students have made extensive hand studies of the text. Tihman

first described the apparent precedence order of characters within words, and demonstrated the preference of certain

symbols, in certain combinations, for the beginning, middle, or ending portions of words. Petersen made an elaborate and

complete manual concordance of the text, and studied occurrences of ligatured and compound forms of symbols.

4*4*1 Phenomena in the Text Which Mast he Accounted for by Any Theory,

The following list of characteristics to be explained by any good cryptanalyuc theon summarizes the findings ot several

researchers, notably the Friedmans and Tiltman: it includes alio some observations which 1 have added from mv own stucK

of the text.

- fl) The basic alphabet of frequently occurring symbols is small las few as fifteen according to some students and
- probably no more than r went v* Five L
- (2 1 The basic forms are compounded or ligarured to create a Large variety of complex symbols.
- (3 1 The symbols are grouped into words*' separated by spaces (although some researchers have expressed doubts about the consistency of this spacing i
- \4) The number of different words seems surprisingly limited.
- (3 I The words are short, averaging around four or five symbob in length, words over seven or eight symbols Lone

are rare, as are also words consisting of a single symbol. Even two-letter words are relatively uncommon, i It should be

pointed out that normal English text also presents an average word- length of about five characters; in English text, however,

there are many one* and rwo-lefrer words, and a great many words of ten to fifteen characters in length, providing a verv

different pattern from that seen in the Voynich text.)

- t6\ The same word " is frequently repeated two. three, or more times in immediate succession.
- (7) Many 'words' 'differ from each other by opiy one or two symbols. and such 'words often occur in immediate succession/
- 18 j Certain symbob occur characteristically at the beginnings, middles, and ends ol "words . and in certain preferred sequences.
- (9i Certain symbols appear very rarely, and only on certain pages, indicating some special function or meaning
- (10) There are very few doublets (repetition of the same letter rwice in succession J. and these involve primarily the symbob " " and " * v *\ ocasionally also " $^$ ", and "O"'. $^$

lllf Verv few symbob occur singly las one-letter words") in running text; these are primarily "C and 9

U2I "Prefix*', like elements are tacked in front of certain 'words ' that also occur commonly without them; such

prefixed elements are \ and " 9 *

i 1 3 1 The symbol 4^{*} occurs almost invariably followed by O". and joined to it by an extension of the crossbar vt

the '"; the resulting compound symbol is rarely seen elsewhere than at rhe beginning of words

- (14 1 On most herbal folios, the first line of the first paragraph begins with a very small set of symbols, pnmanb
- ff •- and " these are usually immediately followed by " CT ^ ", " © '* 9

^ or sr No trace can be found of the alpha bencity that would be expected if the herbal paragraphs becan

with the names . ot plants in alphabetical order as was usual in many early herbab.

(13) Single 'words' occurring as labels next to stars, "drug containers', plant sketches, or other pictorial elements in

various drawings verv rarely begin with the four looped symbob; instead, they often start with " O ", $^{\land}$ \bullet 9 -

and occasionally ** " and " <T V

4*4*2 Cryptanalytit Hypotheses,

In the Vovnich manuscript, we are confronted by a situation with many unknowns. In spite of the diligent and tireless

efforts of many talented researchers over the half-century since its discovery, we soil have very few definite facts to reduce

the large area of uncertainty defined by these unknowns. We still are ignorant of the underlying language: we have lirde or

no due to the nature of the cipher, code, or writing system: we do not know when, where, or by whom rhe manuscript was

written; we cannot even be certain of the subject marrer, or the purpose for which it was compiled. In the following

paragraphs, I will attempt to list, as completely as possible, the hypotheses that a conscientious cryptanalysc might entertain

regarding the nature of the Vovnich cert. In some cases, information turned up by researchers can at least partly rule out

some of these hypotheses, as Elixeberh Friedman has suggested in the passage quoted above. Some theories seem more

capable than others of explaining the phenomena observed in the text, A systematic consideration of all the possibilities wdt

28

serve as j good foundation for the discussion of solution attempts in Chapters 5 and 6 Such a survey will also provide a vivid

picture of the true magnitude of the problem which this enigmatic manuscript presents ro the crvptanalvit

The crvptanalytic possibilities to be dealt with are related to three principal factors, which 1 will designate by capital

letters: P. the nature of the underlying plain text; E. the correspondence or substitution between elements or plain text and

Vovmch script elements; and T, other v a reformations that might have been carried out on the plain text in addition ro

substitution of Voynich symbols. In the following paragraphs, several possibilities will be listed under each of these basic

factors; each such individual hypothesis will be designated by the letter fP. £. or T) followed by an Arabic numeral. I will

assume that the reader is familiar with certain basic terminology and concepts of crvpiology, such as the distinction between

code and cipher, substitution and transposition. These concepts have been clearly defined and explained in mam cjsiU

obtainable general works on cryptanaksts.

- P. The Nature of the Plain Text.
- P.1 Normal Lao n text.
- P.2 Normal text

in some other naturalian guage. 1.

P.3 Code or synthetic language with a mixture of ideographic and natural language characteristics ie.e,. grammatical

endings added to code symbols i.

PA A pureiv ideographic system like picrographs. with virtually no features of natural language preserved

- E. The Nature of the Subsniution.
- J:. i One plain text symbol is replaced by one Vovmch symbol.
- E,2 One plain text symbol is replaced by two I three I Vovmch symbols, but always by the same number of symbols

- E.3 Two (three), but always the same number of plain text symbols are replaced by one Vovnich symbol.
- E.4 Two (three* plain text symbols are replaced by two (three) Vovnich symbols.
- E.5 Mixed length units li.c.. one. two. and three .letter strings) are involved in either or both plain text and Vovmch script,
- E.6 Each plain text unit has a set of variant or alternative Voynich symbol counter pans, from which the scribt could choose at will,
- E.7 Whole words or concepts are represented by single Vovnich symbols or by mixeddength Vovnich strings i as in j shorthand),
- E.S Polva Iphabettc substitution, or the cyclic use of a series of substitution alphabets according to some rule
- T Transformations Other Than Substitution.
- T. 1 No plain text letters dropped, added, or moved.
- T.2 Vowels dropped.
- T.3 Words abbreviated arbitrarily, and represented only by certain letters.
- T.4 "Dummy" characters, or nulls inserted into the text.'
- T.5 Letters or syllables transposed within words (as in Pig Latin).
- T.6 Letters anagram med or transposed over longer stretches of text,
- T.7 Plain text concealed in a much longer "dummy* or "cover text, most of which is meaningless."
- T.8 A Tnthemian or Baconian system, involving the use of some binary or ternary characteristic (dosed or open

letters, tails up or tails down; ligaturing or lade of it; etc..) as the true message carrying feature in a manner similar to the

dots" and "dashes" of Morse code, applied to a "cover" text or "carrier" text which is meaningless in itself

As will be shown in Chapter 9. ail of the above possibilities were known and used by early practitioners of secret writing,

well within the fifteenth and sixteenth centuries. Roger Bacon mentions a number of them man oftencited passage m his

work entitled "De Mirabili Potestate Arm et Naturae" (Bacon 1859) The methods he lists include madeup alphabets,

geometric figures combined with dots, shorthand C ars noiona ' or Tvronian Hand), and dropping

vowels from the

plaintext. In alchemy treatises attributed to him. Bacon is also thought by some to have employed anagramming. simple

substitution (one plain text character to one cipher character), and concealment of a short message within a much longer

meaningless "cover" text.

Using the scheme of individual hypotheses designated by letters and numbers presented above, we can set up a large

number of compound hypotheses embodying various choices in vinous combinations. J will nor attempt to hst all of this verv

In notes mi4c by Mils NHL companion of Mrs Vormdi. she reports that John Manly had expressed his optnmn in a later m M(, Vovnich Ji led,

March 20. 1920 ih*t the text of iht manuscript represents j simple cipher disguised by the use of nulli. In another letter tu VC'jfliam R NewMd at

about the unit date. Manly stated t according to Miss Nitli that frequent v counts he had made based on eight pages of ten, sho wed a comparanveK

si in pie cipher disiruised by extensive use of nulls*

29

Urge ser of possibilities; instead. I will mention a few that seem to be ruled out by the evidence, or at least rendered relatively

unlikely, and a few others that seem more consistent with what we know of the text and thus more worthy of further study.

Hypotheses Rendered Unlikely by the Evidence.

Simple Substitution on in Otherwise Unaltered Natural Language Text, As Elixebeth Friedman and others have

observed, the text probably does not represent ordinary Latin or any other natural language enciphered by simple one-to-one

substitution of Voynich symbols for single tetters (that is. in terms of our scheme. P.l or P.2 and E.l and T. 1 L The short

words, the many sequential repetitions, the rarity of one- or rwo4etter words, the rarity of doublets 1 doubled fetters), all

militate against simple lubscniaon. So also does the strange lack of parallel context surrounding different occurrences of the

"same" word as shown by word indexes. In the words of several researchers, 'the text just doesn't act like natural language

An Ideographic or Symbolic Representational Scheme. At the other extreme, a srstem involving our hypothesis P.4 u

purely ideographic or pictographic system, preserving no trace of endings, grammatical forms, or anv of the structure o*

alphabetic strings) is equally unlikely. This possibility is ruled out by the salient beginning, middle, and

ending structure

demonstrated by Tilcman and since repeatedly confirmed The prefix-like en Does and the obvious similannes between words

also indicate that there is some degree of language-like structure, involving umts smaller than whole words or ideas, to the

Voynich text.

PolvaJphabetit Substitution. Hypotheses involving E.S (the cyclic use of several different subset cuoon alphabets according

to some rule) is rived out, as noted by EUzebeth Friedman, because there is far too much structured repetition in the text

Polyalphabetic iv? terns, like the well-known Vigenere table, are explicitly designed to obscure the many patterns and

repetitions in natural text which provide helpful break -in point for the would-be decipherer. The frequency counts of

occurrences of Voynich characters throughout a sample of text are also too "rough" — that is. some characters are infrequent,

while others are very common — for a polyalphabetic system, which obviously. with its many alphabets, tends to "'flatten

oui" the frequency distribution for the text as a whole.

Transposition Systems. Systems involving anagram mmg or transposing letters over arbitrary sequences of text (T.6) are

also unlikely for a number of reasons; first, the many repetitions of similar strings of characters in dose proximity fe.g.,

-JoYr*c9 +ofl\-r<j " Ind re «««*• the numcrous lhort

words used as labels or captions; and third, the difficulty, ambiguity, and tedium of such methods for so Urge a volume of

text, together with the difficulty of reading and deciphering what was probably a reference work to be consulted by more

than one person.

Some Hypotheses Worthy of Further Consideration. Having narrowed the field somewhat by setting aside some of the

possibilities as unlikely, we can concentrate our attention on certain others that seem more promising. I would like, first, to

suggest certain general considerations that appeir relevant to the nature of the wrmng system in the Vovmch text. Whatever

method of concealment was used would have had to be relatively easy to empiov and to remember. The sheer volume of text

(estimated at 250,000 characters) militates against any elaborate, multi-stage process such as that proposed by New- bold.

The ease and naturalness and the cursive quality of the writing also argues against any tedious and involved sequence of

enciphering operations (unless, of course, we assume that the ennre manuscript had been copied from an earlier original).

The recent research of Prescon Currier (ice Section 6,S below) indicates quite dearly that there were at least two different

scribes or scholars who worked on different folios of the manuscript. This implies that the system had to be such as to permit

its joint use by several persons — a very important new bit of information. As has apparently been assumed without question

by most students, the script was almost certainly written from left to right; this is shown by the clockwise progression of

circular diagrams, the presence of starting markers on the left, the slant of the writing around circles, and the arrangement of

lines on a page. Finally, it seems reasonable to me that there must have been other documents written in this script, and also

one or more code books or dictionaries in use among the small secret society of scholars who employed the system. There is

always a chance that such materials will turn up some day to throw some new light on the enigma. Considering these general

factors and what is known about the behavior of characters in the text, the hypotheses below seem in mv opinion, most likely

to repay further investigation.

Laun Text With Vowels Dropped. Dropping vowels from Latin produces text having very different character iso cs from

those of normal Latin Text. Single Latin letters may be represented by single Voynich symbols, or. more likely, by mixed-

length units; possibly variants a choice of more than one Vovmch symbol to stand for a given Latin symbol) are also

included, as well as nulls (dummy, meaningless letters chosen from a small set of alternatives and inserted irregularly

throughout the text). Such a concealment system may be represented in our scheme of hypotheses as fP. 1 and T.2 and (E.1

or E.5) and possibly also E.6 and T.4). These combined operations could all be carried out easily, naturally, and rapidly by a

scribe after some praaice and familiarity with the system. The resulting text would be verr difficult to decipher for anyone

unfamiliar with the method, and relatively easy for the initiate. A problem arises in dropping vowels from Latin, in that

many important small words like "de" and "ad'\ "ef and "ut'\ 'sif and 'est'* become indistinguishable. and some words

consisting only of a single vowel disappear entirely. This might not be a serious problem for readers and writers who knew

what (he text was about and were closely familiar with it.

Abbreviated

Latin Words, Conventional Latin abbreviations, represented by mixed-length Voynich character strings or

code - 'like entities, possibly with the added complications of variants and nulls, presents another likdv possibility (P. 1 and To

and E + 5 or E.7; optionally also E,6 and T.4), This, too, would be easy to learn and to remember, and easy to read lor the

inmate within the secret circle, but highly difficult for anyone outside it to penetrate,

Latin Text. Enciphered by Simple Substitution. Concealed in a Longer Dummy Message. This hypothesis iP.l and E l

and T.7) would explain the many strange repetitions of highly similar words in close succession; one of rhe words represents

a pan of the actual message, while the rest are nonsense sequences made up, like meaningless babbling, and inserted to

conceal the true cipher string. The scribe, faced with the task of thinking up a Urge number of such dummy sequences,

would naturally tend to repeat parts of neighboring strings with various small changes and additions to fill out the line until

the next message -bearing word or phrase. This theory would also explain the frequent illogicality and lack of consistent

sequential structure in stretches of text which has so frustrated irudenn.

A Synthetic Language or Code fP.3 and E.7; optionally also E.5 and E,6 and T.4). The most likek hypothesis in im

opinion involves a simple code based on a small glossary of a few hundred Latin words related to plants, median*,

astronomy, weather, and other topics of interest to the scribes of the manuscript. The root or base forms would be

represented by one. two. or three Vovnich Symbols standing for a page number or column number on a page, or tor a

philosophical subject category as was usual in early universal or am final languages. (See Section 9.3-1 Endings or

grammatical forms could then be represented by the strings of symbols in ctrutn preferred orders noted by Tikman and

others at the ends of words. This, too, was a common feature of early synthetic languages. The addition of mixed -length

variants for bases and affixes, and the insertion of nulls, all common practices in early codes used by the Catholic Church,

would provide a complex concealment system exceedingly hard to penetrate for the outsider, while still very easy for the

inmate to use. With some practice, it could be memorised almost Like a natural language, especially if its basic vocabulary

was as small as seems likely from the evidence,

A system of this kind would require one or more copies of a code book or dictionary to be consulted by users of the

language. In Seaton 9.2, an early Vatican code (Silvester 1526) which exactly fits the above description will be discussed in

some derail. Currier's findings concerning the differences in certain charaaer frequencies and combinations betw een samples

of text in two different "hands" are highly significant in this regard. A possible explanation is that one scribe used certain

variants in preference to others, or employed the system of endings" a little differently, in contrast ro

the practice of another

scribe. These and other hypotheses will be discussed further from various points of view in Chapters 5. 6, and 9.

31

Chapter 5

Major Claims of Decipherment

The survey to be presented here will be quite brief* except m the case of the most recent claim, by Robert S. Brumbaugh ot

Yale University. The solutions put forward by Newbold* Feeiv. and Strong have been thoroughly dealt with by other writers,

in treatments published in relatively accessible -source*. T will -provide only a rapid sketch of the main points regarding their

work* for the sake of completeness, for students new to the problem* and for methodological reasons.

5.J Newbold

Pro:. Wilham R. Newbold was among the first scholars to whom Wilfrid Vovnich gave copies of the manuscript simr:

after us discovery, in the hope of getting it deciphered and translated. Newbold* a student of medieval philosophy and

science, published hts first presentation in 1921. He worked on the manuscript and on other alchemical texts attributed to

Roger Bacon for several more years before his sudden death. Worksheets and notes ot hts research were edited and published

by his friend and literary executor. Prof. Roland G. Kent (Newbold and Kent 19281. Newbold was familiar with the system

of esoteric mystical philosophy developed by the medieval Jews in Spain and known as the Cabala (or Kabbalah K He studied

the sentences in a mixture of scripts on folio 1 I6v, and was immediately struck by a phrase "michi * . . dabas

mult as * * . portas" (as he read it), which he translated 'Thou wait giving me many gates', (For several different readings ot

folio 1 16v, see figure 23)- The word "gates" (Larin "portae" or "portas") was used in the Cabala, according to Newbold. to

refer to all possible combinations of the letters of the Hebrew alphabet, taken two at a time Assuming from the outset,

following Voynich, that Roger Bacon was the manuscript s author. Newbold brought to bear evidence that Bacon **is

familiar with certain aspens of Cabalistic lore; he rites references in Bacon s Greek Grammar and his fragmentary writings

on Hebrew (Bacon 1902L as well as his comments concerning concealed writing (for which see Section 4.4.2 above, as

evidence of this familiariry.

Starting with this due* Newbold examined some other works on the subject of alchemv attributed to Bacon* and claimed

to have discovered a cipher used by Bacon for concealing messages within innocent-appearing Latin text ithe method 1 have

designated T.7 in Chapter 4). He maintained that a variant of this method had been employed in the Vovnich manuscript as

well. Thus* Newbold ascribes two different, but related* cipher systems to Bacon: first* a 'Latin text' cipher from the

alchemy treatises, and second, a more complex "shorthand cipher' used in the Vovnich manuscript.

5. L / The Latin Text Cipher.

In the Latin alchemical manuscripts, a message was hidden, according to Newbold, within Latin words so chosen and

arranged as to appear to be a treatise on alchemy or on a related topic. Alchemy texts were always expected to be mysterious

and nonsensical to the uninitiated (and. one suspects* to many would -be initiates as well) : such a work would thus provide an

ideal cover " for a secret message. Each pair of visible Latin letters in the cover text stood, in New bold's view based on iht

Cabalistic "gates' for a single underiving plaintext letter. In this sysrem, 484 letter-pain f twenty -two letters taken two at j

umc) were generated, so that each of the twenty-two letters of the plaintext alphabet could be represented by any of rwentt -

rwo variants"* or alternative cipher pain. A restriction was placed by Newbold on this large number of alternatives, such

that pairs chosen to substitute for a plaintext letter in a word must have the first member of one pair the same as the lasr

member of the preceding pair. For example, if "uni us" were to be enciphered, it might be represented as "or-ri4t-tu-uf;

the doubled letters would then be dropped, giving oritur"* a good Larin word (see Newbold and Kent 1928. p. 5 3 ff and

Manly 193L p, 34 ff for a fuller explanation)* Added complexities were introduced to provide a cover text that appeared to

be acceptable Latin and would not (at least in an alchemy text) arouse suspicion. These added steps involved a many-man\

substitution* and on top of that, a rearrangement or anagramming of letters within passages of fiftv*five or one hundred and

ten characters of text (our method T.6 L

33

5. L2 The Shorthand Cipher,

As described by Newbold (Newbold and Kent 1928, p. 1061 there were six steps to be followed in deciphering the

Vovmch text;

- 1 Transliteration identifying the shorthand characters, and transliterating them in order.
- 2 Syllabification: doubling ah but the first and last characters and arranging the resulting stnnc in pairs with the first

member of each the tame as the last member of the preceding pair

3- Commutation: In any pair where the second member is one of the 'commuting set 'C O. $N\ M$. L . T. A*Q

change the first member according to a "conversion alphabet* provided by Newbold. Where the first member is j

commuting letter, change the second by a * reversion alphabet* provided: where both are commuting letters, chance both,

each by the indicated alphabet.

- 4. Translation; assigning to the commuted pairs their alphabetic values (by lookup in a table)
- 3. Reversion: Changing 'Alphabetic, values! m' phonetic xalucs" (the exact nature of this step is not clear 3
- 6 Recomposition: Anagramming the letters to produce meaningful text.

The shorthand * referred to in step 1 was supposedly based on an ancient Greek system of abbreviations, and wjs to be

applied to each character of the Vornith script as inspected under a reading glass and broken up into mam tmv component

curves and lines. Extensive tables are provided m the back of the book to enable the student to cam out all the necessary

reversions, convei sions. translations, and so forth.

Newbold and Kent provide good illustrations of a number of folios from the manuscript, chosen from various classes ot

drawings: decipherments of the text on these folios are also presented* which bear little or no relation to the pictures For

example, a tale concerning two ancient Romans ts read on a page with an astrological drawing (folio 72vJ, Human figure

folios are read as describing procreative or gynecological matters, with at least some apparent justification (ova. fallopian

tubes, spermatozoa, etc.) in the drawings. This seems to be a frequent reaction on the part of modern students to the naked

female figures on folios 75 ff. Other drawings are taken as recording the appearance of a comet (folio 7lv). an observation

of a spiral nebula (folio 68v3l. and an annular eclipse (folio 67v2).

The claims of Newbold were hailed with great enthusiasm by Vovmch and many others, who wrote numerous reviews

and commentaries (Bird 1921. Garland 1921, McKeon 1928). Roger Bacon enjoyed a spectacular, if brief, moment in the

sun. while he was credited with the invention of the compound microscope and telescope, and the anticipation ot many

twentieth -century scientific discoveries. Catholic writers exulted in oriumph on the one hand over what rhev saw as a

vindication of medieval scholastic philosophy, and frU over one another on the other hand in their haste to apologize lor.

excuse, and minimize the persecution and neglect inflicted upon the thirteenth -century "forerunner of modern science ' by

his superiors in the Franciscan Order (Reville 192L Walsh 1921 J. Even a number of prominent Baconian experts and

specialists in medieval philosophy accepted Newbold's claims uncritically, and manfully strove to assimilate the indigestible

anachronisms into their knowledge of Bacon 1 work and thought (Carton 1929. Gilson 1928). Some less credulous scholars

were taking a harder look at Newbold's theories, and expressing their doubts (Steele 1928: Thorndike 1921* 1929:

Salomon 1934).

At the same time another scholar* Prof. John M. Manly, a professor of English ac the University of Chicago, had

interested himself in the manuscript, and had been (according to his own words I 'dabbling" with it for several years at odd

times . Manly was a friend of Newbold's, and had corresponded with him: Newbold had discussed his methods and findings

with Manly over some time, In 1921. Manly published articles in Harpers Monthly Magazine (192 lb) and in the American

Revieu of Renews (1921a). expressing a mildly favorable or neutral reaction, but also giving voice to some doubts and

cautions. After Newbold's death in 1926. and the posthumous publication of his work in the book edited by Kent. Manly

published another, much more outspoken article in Speculum (19311. emphatically disproving and rejecting Newbold s theories.

This is how Manly expresses his views in the Speculum article: "The more I studied the nature and operation of the cipher

system attributed to Bacon, the more clearly did 1 see that it was incapable of being used as a medium of communication* and

was indeed not Bacon's work but the subconscious creation of Professor Newbold's enthusiasm and ingenuity 1 told

Professor Newbold mv conclusions and gave my reasons for them in several letters*, , /" (1931, p. 347), Manly goes on to

explain that, while he would not have chosen to make a point of attacking his late friend's work, he felt that it was necessary

to set the record straight in view of the unquestioning acceptance accorded to the theory by so many prominent authorities

He says, "One of the most eminent philosophers of France, Professor Gilson, chough bewildered by the method, has

accepted the results; Professor Raoul Carton, the well-known Baconian specialist, in rwo long articles,

34

and results with enthusiasm; and American chemists and biologists have been si mi lari v impressed. The interests of scientific

truth therefore demand a careful examination of the claims of the Newbold cipher" Ip 347*. (See Carton 1929. Gilson 1928*)

Manly' makes the following flat statement at the outset: *Tn my opinion* the New bold claims are e^tr-clv baseless and

should be definitely and absolutely rejected" fp* 347)* He explains that the tiny Lines and curves Newbold saw as microscopic

Greek shorthand symbols were due simply to cracking of the ink on the rough surface of the parchment* thus vitiating step 1

of Newbolds method. A second telling attack is focussed by Manly on the sixth and final step, involving anagram mine

letters in stretches of fifty-five or one hundred and ten text characters. He demonstrates the amazing number of reasonable

sentences, even including rhyming poetry, that can be generated from a single short passage by anagramming. For instance,

he considers a sentence in one of the aiehemv treatises attributed to Bacon: "innpium quaedam caret quaestiunes Bernard*

cum sun responsionibus et e«. * * .** From this sentence. Newbold had obtained the following: "Dc via et terra et coelis

despioc mixta prinapia lumejnj"- Since each letter of the original sentence, in Newbold s ' Latin cipher system, can have a

number of alternative equivalents, a huge number of possibilities present themselves for selection even before the

anagramming begins. This is the sentence for which William F. Friedman, working in cooperation with Manly to test

Newbold's theory, obtained the anagram "Paris is lured with loving Vestals. . . /*, simply by choosing a different set of

equivalents and a different arrangement among the many possibilities. For a full discussion of the problem oi anagram mine

and the aitfalis of Newbold's theory, see Manly 1931. pp. 330 ff and Friedman and Friedman 1959.

Man. v s article in Speculum succeeded in laying to rest Newbold's theories, and Friar Bacon returned again to his

accustomed scholastic obscurity* consigned to even deeper darkness in an over -reaction on the part of some modern scholars

against his illusory role as originator of twentieth -century scientific instruments, and observer of astronomical and

gynecological secrets 600 years in advance of their appointed time. (Note, in particular* the savagely critical and

"debunking" attitude toward Bacon expressed by Thorndike 1916 and 1923-195SJ It seems probable

also that the

controversy over Newbold's work, the amount of publicity it received, and its complete destruction so closely following upon

its uncritical acceptance by majiy prominent experts who presumably should have known better, caused many, scholars to

wash their hands of the manuscript and to steer clear of any serious involvement with the problem it presents. If a scholar of

Newbold's impressive reputation and knowledge of medieval philosophy could be made to appear so deluded and foolish

after so many rears of painstaking effort, it is easy to understand the reluctance of other scholars to risk their ow n reputations

and peace of mind on the problem.

5-2 Feely

Eluebeth Friedman 11962) describes Fedy and his claim to a solution of the manuscript as follows "In 1943* j

R ochester lawyer. Joseph Martin Fee) v* published a book entitled Roger Bacon's Opher: The Right Key Found. Feelv was

the author oi Shakespeare's Maze t Deciphering Shakespeare, and other items catalogued in the Friedman Collection under

the heading Cryptologic Follies. " However unacceptable his results may have been, he started his researches in a sensible

manner, according to his description of them in his book: coming upon the manuscript through the pictures in the Newbold*

Kent book* he did frequency' counts on Roger Bacon's Latin in several works, including De Perspectna fa work on optics*

and Commuma Naiurahttm 1 concerning natural science).

Feely noted that the leaders" fby which he apparently meant the highest-frequency letters) m Bacon's Latin comprised

the letters "E. I, T, A, N, U. S', and he attempted to make a parallel analysis of lener frequencies in the Vovmch text* on an

assumption of simple substitution four hypothesis P. 1 and £. I and T. 1). From these studies he moved quickly on to attempts

at cribbing" various words that might be related to the drawings and their accompanying text in the manuscript He

remarks with obvious exasperation chat the Latin in Bacon's manuscripts was highly abbreviated: he estimates the text to

have been reduced in length by thirty-five percent through this practice. He comments, also with evident annoyance, upon

the differences between medieval and classical Latin. These difficulties apparently frustrated and hindered his statistical

researchers to a considerable extern, and perhaps drove him to the much eaiier and less demanding approach of guessing at

possible "cribs" in the text*

Fed vs attempts at cribbing apparently met with some success. On folio 78r, shown in Newbold and Kent (1928* Plate

V), Feely found his first break into the text. This page is one of those showing nude female figures bathing in pooh or tubs of

liquid. Feely assumed that two cloud- or grape -duster objects at the top corners of the page (see figure 1 5 for a detail, of one,

of these > were ovaries" and that the channels leading down from them and joining m the middle of the page were

transmitting "ova ' into the two "sacks ' below. In the " sacks," according to Feelv. the "ova " were shown as female figures

standing in the liquid. There are "labels" in the Voynich script next to each cluster, the sections of pipe conducting the

35

stream of mystenous Jubilances from them, and the pooh into which they pour. Feely obtained his first "dews <:as he likes

to call the results of his cribbing) by a study of these labels and an attempt to assume various Lmn words they might

represent. Figure 25 shows the results he obtained from these initial researches,

His initial "dews' provided Feely with a number of letter substitutions for common symbols in the Vovnich script, w hich

he then employed m an effort to puzzle out the remainder of the text on the same page. It should be noted that he at no time

had access to a complete photocopy of the manuscript; he carried out all his work on the illustrations in Newbold and Kent

1928. The plaintext which he obtained was a crude, abbreviated pseudo- Latin, which he translated 10 produce English text

on gynecological topics for folio 78r. On folio 68v> (Newbold and Kent 1928. Plate XXII). he claimed to have found

Greek words, and to have deciphered a mysterious reference to a

statue of Memnon (Feely 1943. p 37 h On other folios.

Feelv claimed to have found the personal diarv of a scientist observing living cells under magnification the informal

jottings" of an early researcher, hidden in cipher from the hostile eyes of religious authorities

Although he hedged a bit at coming out flatly in favor of Roger Bacon as author of this scientific diary. Feely maintained

that his decipherment tended to support and confirm Bacon- s authorship. Figure 25 shows the alphabets he developed as 4

result of his studies (probably by successively cribbing and then guessing at letters to fill in the gaps, forcing his assumptions

until he produced something like Linn. etc., in a cut -and- try fashion). Like many other students, he saw the Vovmch script

as containing many compound symbols built up from simpler forms Unfortunately for Feelv. however, no other student has

accepted his soiui.on as valid. Tiitman. summing up the general opinion, dismisses Feelv s efforts as follows His

unmethodical method produced text in unacceptable medieval Latin, in unau then tic abbreviated

forms" t 1908. p,6>.

5. 3 Strong

Professor Leonell C Strong, a highiv respected medical scientist in the field of cancer research at Yale University, became

interested in the Voynich manuscript when he saw O "Neill's article f 1944) dating the manuscript alter 149?. He took up

the riddle of the enigmatic book in the context of a long-enduring interest in Renaissance literature. Over a five-year period,

he attempted without success to obtain copies of the text for study. He was forced, finally, to carry out his analyses in the

same wav as Feely had. on the basil of illustrations of individual folios in published works concerning the manuscript In due

course, he published a brief article claiming a solution to the mystery (19451. His decipherment was based on what has since

been termed a "peculiar double system of arithmetical progressions of a multiple alphabet. indicating chat the Vuvnich

manuscript author was familiar with ciphers described by Tnthemius. Porta, and Seleni" iMcKaig nd. p. 49i.

Strong s decipherment resulted in what he claimed to be a form of medieval English; he attributed the manuscript to one

Anthony Ascham, brother of the better -known Roger Aseham or Askham. a tutor to the children of the Royal House ui

Tudor in the sixteenth century. Anthony was a physician and astrologer; he published several almanacs, a treatise on

astronomv. and .an herbal lAskbam 1548a. 1548b. 1550. 1552. 155J). As described by NfcKaig in.d., p. 49). Strongs

efforts produced text presenting "an extremely candid discussion of women's ailments and practical matters of the conjugal

bed — you might call it a sixteenth -century equivalent of the Kinsey Report". He identified an herbal contraceptive among its

recipes, and ran a laboratory experiment to test the effectiveness of the prescription for that purpose The ingredients

comprised pitch from the nit bark of pine trees, honey, and "oil of spindle. 1 * Strong claimed that the oil of spindle was found

in his experiment to have caused spermatozoa to lose their motility, thereby verifying its effectiveness as the active ingredient

of the contraceptive (Strong and McCauley 1947, p, 9001. The details of his cryptanalytic work and his merhod of

decipherment, however, have apparently never been explained, and remain problematical

Strong s plaintext, of which he provides several examples in his articles (Strong 1945. Strong and McCaulev 1947 j, has

been rejected by other scholars as completely unacceptable for medieval English. The reader may arrive ai his own

conclusions from the following sample: "When skuge of run e-bag rip. sco uogon kum sli of sc mosure-issue ped-stans sku-

bent, stokked kimbo-elbow crawknoi. This astonishing string of letters is translated by Strong thus: "When the contents of

the veins rip (or tear the membranes l the child comes slyly from the mother issuing with the leg -stance skewed and bent

whik the arms, bent at the elbow, are knotted {above the head} like the legs of a crawfish." (Strong 1945. p. 60S.) To m\

mind, at least, this seems a highly unlikely thing for any writer of any age to have said, whether in cipher or not. It seems

strange to me, also, that so many students have become obsessively preoccupied with gynecological or sexual interpretations

of the text. The presence of the scattering of quite unexceptionable 1 matronly little nude figures on a small proportion of folios

seems to me an entirely insufficient justification for this obsession.

Nothing further has been heard from Dr. Strong in support of his theories, to mv knowledge, even though the Vovmch

manuscript has now been accessible to scholars at Strong s own University, Yale, for a number of vears According to

Eltzrbeth Friedman, "experts said that what he produced was not medieval English. As for his cipher "method . he said little

about it. but what he did sav made no sense to cryptologiscs ' (19621.

36

5.4 Brumbaugh

Robert 5. Brumbaugh, a professor of medieval philosophy at Yale University, became interested in the Vovmch

manuscript during the thirties, and when it was donated by H. P. Kraus to Yale, he was drawn by an irresistible impulse

to look at if (Brumbaugh 1975. p. 348). He was also struck by O' Neill's identification of American plants in the drawings

(1944). Brumbaugh published an article in Speculum (1974) announcing that he had solved the mystery, and had read

some labels on plant pictures in the pharmaceutical folios as well as what he refers to as star maps from folio 5 orf i 19 $^{\sim}$ V

p, 348). He also states that he has dea phered the name of Roger Bacon in the "kev' sentences on the last pace He regards

the manuscript as a deliberate forgery for the purpose of fooling Emperor Rudloph 11 ot Bohemia into parting with the large

sum of money he paid for it.

Scaring that the complete solution will take a lot more study. Brumbaugh still claims that extensive work with a section

on astrology, with some botanv. and frequence studies of samples throughout the text show that my decipherment is correct

(1975. p, 348). He makes tons id cn We-ttse of like sequences of symbols in the margins of folios lr. l T r, 49v. oor.

and 76r. and in the second ring of 57 v. as well as the sentences on 1 16v; these sequences, while to some extent deliberately

misleading, sail provide aid in penetrating the cipher, according to Brumbaugh. The text on folio 1 16v Brumbaugh finds to

be enciphered using what he calls, without further explanation, a standard thirteenth <entury cipher' f 19^5, p he

sees confirmation for this in the paired sequences in left and right margins of folio lr. in which he finds a monoalphabetu

substitution of two normal alphabets, with "a" of one set against "d" of the other. Using this cipher, and some

rearrangement of syllables, Brumbaugh obtains "RODGD BACON" from a portion of folio ll6v which he reads us

"MICHI CON OLADA BA' (note that this is the beginning of the same text string that Newbold read as "M1CH1

DAB AS MULT AS . . PORT AS") He suggests that the name was * planted " in such a manner as to be easily seen tn

Rudolph's experts and thus to attract and delude them into accepting the anrihunon of the manuscript to Bacon.

On folio 66r. Brumbaugh sees a set of "formulae in the words and letters scattered down the right margin, these

formulae, he suggests, serve to equate symbols to other symbols by a son of "crvptanthmetic." of which he provides several

examples (1975. pp 350-351). I must confess that, while those he explains are convincing enough, the rest of the

formulae" remain somewhat mysterious to me m the absence of further clarification. Using these equations' and the

recoveries of labels for plants (which he "cribbed ' bv exploiting word patterns with repeating letters such as p and e in

"pepper." "pa" in "papaver." etc.), he sets up a four-by-mne table of correspondences: he says that this table is similar tu

a standard alchemist * or astrologer s cipher, well known m the trade" (1975, p. 351), and he finds among the text of 11b

the words quadnx nomx' which he sees as referring to this four-by-ninc structure. Figure 2b shows the cipher box

Brumbaugh recovered it.

All the Vovmch symbols. Brumbaugh suggests, stand for forms of the numerals zero through nine tor one through mnt.

the function of zero; if anv. is not made dear in hts presentation). The encipherment, as he sees it. is a mo-step operation,

which first replaced Letters by numerals using the four-by-nine box. collapsing the letters of the alphabet onto the nine digits,

and then substituted choices among several different fanciful designs for each numeral in order to conceal their identity

designs chosen from modern and archaic numeral forms. Greek and Latin letters, and several cursive compendia" (1975. p

35 3). It will be noted that this process involves multiple variants in both the Vovmch script and the

plaintext Decipherment

involves first recognizing the numeral underlying one of its variant forms in the Vovmch script, then writing under tt the

cwq. three, or four possible choices of plaintext correspondences, when this has been done for a word, a pronounceable

sequence of letters is selected from among the choices.

An example of the application of this method to a portion of folio 1 16v will serve as an illustration of the procedure

Brumbaugh singles out a sequence of eight Voynich symbols from rhe mixed text on this page. | use preceding a phrase that

he reads as High German: "valsch ubren so rum ga nichr and translates as the above is false so do not take it

Identifying the eight Vovmch symbols with numerals according to the correspondences he has set up {which he does not

explain anywhere

in his papers except in very fragmentary form), he obtains the digits "0 2 0 2 7 3 3 9" Assigning to these

their multiple plaintext equivalents from the mne*bv-fotir box, he produces the following:

0 202 733 9

ABABGCCI

JKjKPLL.

VRVRYWW-US

37

He selects among the few pronounceable alternatives * AKABYLLUS. ARAKYLLUS, AKARYCCUS. L r RUBYLLL T S.

ARABYCCUS, etc..) the word 'ARABYCCUS". which he sees as a reference to the Arabic numerals underlying the cipher

In his first article f 1974), he presents a number of other examples of his method drawn from plant labels on pharmaceutical

folios. In most cases, the choice among pronounceable possibilities ts quite limited, a phenomenon that lends credence to the theory.

The plaintext produced by Brumbaugh's decipherment is described by him as 'an artificial language, based on Latin, but

not very firmly based there: its spelling is phonetically impressionistic: some sample passages seem solely repetitive padding

To add to the decipherer's problems, 'the upper cipher key changes slightly every eight pages '1 1975. p> 354). Brumbaugh

asserts, plausibly enough, that such ambiguities, while rendering « cipher system unsuitable for modern

military use. were

customary and expected in magical, astrological and alchemical texts of the times in question.

Tiitman (1975) makes these critical comments regarding Brumbaugh s theories: "The idea that the manuscript is a

forgery is not original to him. I suggested it as an uncomfortable possibility tn 19)1 He claims that all the symbols in

the script are really digits in variant forms and that the kry is a fro* providing single digit substitution for letters . . . i.e. each

digit represents two or three letters All this is so ambiguous that it can only be justified by the production of a great deal

of confirmatory evidence, but he supplies hardly any evidence at all aid 1 remain quite unconvinced Brumbaugh ts not

alone in assuming the symbols to be numbers in various forms. This has been suggested several times. '

Mv opinion on a careful study of Brumbaugh"! two published papers is chat his theories are quire plausible on the face of

such evidence as lie presents. His proposals are based in. and explain, more of the observed phenomena in the manuscript and

what is known of its history than chose of any other decipherer. I have made two painstaking attempts to reconstruct as many

as possible of the variant forms for numerals he mentions in his articles, tn so far as l can guess at them from his brief and

frequentK cryptic references. From the fragmentary set of correspondences I havt thus obtained. J have attempted some

decipherments of other plant labels and isolated text strings wuh mixed results. A lot of them are meaningless, so far as I can

sec, and some are suggestive of Latin or pseudo-Larin words; many are very similar (as would be expected from the known

repetitiveness of the text). There is fust enough plausibility in the process to lead one on. but not enough to leave one

satisfied. Figure 26 shows my very conjectural attempt to reconstruct Brumbaugh's variants with their correspondence eo the

rune-by-four matrix, and a sample of his decipherments of plant labels.

A new article by Brumbaugh has recently appeared in the jottmtl of she I mnd Cavnatdd \nsmutts* University of

London (1976). In this article. Brumbaugh up that his recent research has convinced him even more firmly of the cor-

rectness of ha decipherment

Chapter 6

History of Other Substantial Analytic Efforts

6.1 The Forms in Which the Manuscript Has Been Studied

The Voynich manuscript was for a long time held in private hands, first by its discoverer, Wilfrid Voynich, rhen by his

widow, and finally by H. P. Kraus. Because of its great financial value, its owners were understandably rductant to alio*

unlimited access to it or reproduction of it;* although they 4rrqu end y cooperated with serious scholars seeking to unravel the

mystery In the first few years after his discovery of the manuscript, Voynich made vigorous and repeated attempts to interest

students in it. and Newbold was introduced to the problem through his efforts. It is possible that the disastrous outcome ot

Newbold's researches, and the disappointment occasioned by their failure may have resulted in an atmosphere ot caution

and of greater restriction on the pan of the owners in providing access to the manuscript in subsequent years

As we have seen in the previous chapter, Feelv and Strong were able to study the text on lv through illustrations in tht

published works of Newbold and others. The manuscript has come before the eyes of many other students, however, in the

form of phocostatic copies. The copies used by Friedman, Tiltman. Krischer. and Currier, and the copy available to me, all

derive ultimately from a photocopy made by Father Petersen of Catholic University on April 29, 19}1. from a set oi

photostats provided by Mrs. Voynich. Tiltman fin a report of Petersen's work made in conjunction with an inventor v of his

papers after his death in 1966), states that 'virtually all copies of the manuscript in private hands are derived from Fr.

Petersen's photostats/' The pages I have studied are, in fact, copies of copies at four or five removes. Friedman (in a note

accompanying the copy m the Friedman collection) provides this interesting account of the photocopies in private ownership

at char rime, and how they came into existence:

On 2 1 Mav 1944 W| illiam J Ft . | Fjricdmin j wrote a lerter ro the widow of Dr. Wilfrid M Vuvmch who was (he discoverer tit ihiv

famous manuscript, requesting a phofosrenc copy The requeir was granted and a complete copy was made from a neifitive phobriutii oipt

provided by Mrs Vormch. In her kner dated 31 May 1944, she stated thit photostanc copies were exrremely rare one is m the

York Public Library, another is in the British Museum . another was given to Dr Petersen of Carbolic University, another was fivers to j

scholar whom Mrs. Vormch did not idenufv: fmallv Mrs. Vormch hersell had a copv. With the copv tn the Friedman collecrmn there mi*

appear to be in all si a copies in the world

In general, (he photocopies I have seen provide a degree of definition and clarity' which is quire remarkable Details or

penstrokes, guidelines on diagrams, and other fine details show up very well, and the text is dearly distinguishable almost

everywhere. Certain deficiencies should, however, be mentioned, since they may have had a definite limiting or distorting

effect, however slight, on the research carried out by many students. First, the complete lack of color in the black and white

copies inevitably results in a loss of some meaningful information. This may be important not only in identifying plants and

in understanding the meaning of other drawings, but even in isolating some details against a dark background. When

everything is seen only in shades of grey, writing or small designs within colored fields are sometimes indistinguishable The

same difficulty can anse in cases where the photocopy is very dark, so that the grev background obscures many details.

A second defect of the photocopies available to me applies primarily to the large, multiply -folded folios. Because the copies

had to be made in pieces, their over -a II relationship to form a whole is often very difficult to reconstruct: (he student does not

see the complete system of drawings as they appeared in the original form. Worse vet. in some cases material has evidently

been obscured by being out of focus around the edges of a page, or has been partly cut off, so that we do not see everything

that was on some pages in the original. This is notably the case for the large, intricately folded folio 35-86. containing a

complex system of inter -related circular diagrams.

Another feature of the photostats 1 have studied, while not constituting as much of a hindrance to research as some of the

problems already mentioned, is annoying and at times confusing to the student. There are numerous notes, circles,

underlines, and other oomngs and scribbJmgs of modern researchers on many pages. Among these are copious and obtrusive

I informed b\ Mr James GiUoglv. who has studied ihu copi. ihaT it is incomplete, comprising only abour ihe first third of the manuscript made up primarily of plant folios.

39

remains of at least one previous computer processing project, including circled words and paragraphs, lines marking off pans

of rhc reset, and legends such as start here . omit punch' . and punch just this." in some cases, these comments and marks

cross the text and drawings in such a wav as to obscure or confuse some features of the original Generations of cryptanalysts

have indulged their characteristic and apparently irresistible habit of underlining patterns and repetitions, and have otherwise

triumphantly noted their guesses about the meaning of the diagrams I "the four ages of man/' "the four seasons f.

"Sagittarius — archer"), While one can empathize with the momentary joys and sorrows of one s predecessors as thev

struggled with the enigma, most of these jottings are trivial at best, and at their worst serve only to further aggravate the

difficult of the task I, for one, would prefer to see nothing more on the pages than what Wilfrid Vovmeh saw when he first

viewed them in 1912,

A final unavoidable disadvantage of working with copies is the inability of the student to venfv or reject hypotheses

concerning the faint, parti all v-erased writing in other scripts and hands discussed in Section 4.2 above. Without a careful

examination of the original, perhaps aided by special chemical or photographic techniques to reveal the faint fragments of

writing more fully, we cannot

make the most of the opportunity they provide for a crack in the smooth shell of the mysterv So little "crib" information is available; the scribe or scribes were so consistent in "enciphering or "encoding* everything,

leaving no clues "in the dear", that we need every precious bit of added information we can glean from these extraneous or

atypical scribbling*, whatever their source.

Such, then are the photocopies with which mosr of the students have worked whose researches will be described in this

chapter The first problem facing the analyst has been the attempt to arrive at a firm set of elementary symbols comprising un

alphabet" for the Voynich text. We have seen in Section 4,1 and figure 19 the wide differences between transcription

alphabets adopted by different students. Armed with a list of symbols that satisfies him at least as a beginning, each student

has then set about the task of making counts, indexes, concordances, and other anal vies, either by hand, or if he is so

fortunate as to have access to computers, by machine Some students have copied or transcribed large quantities of text by

hand; this is a good way to get the "feel" of the text, and to become familiar with the symbob and their variant forms. In the

remainder of this chapter, several major analytic efforts will be reviewed. These studies, while not leading to a claim of a

derisive break-in or decipherment. have in many cases added substantial I v to our knowledge about the manuscript; thev are

informative also from a methodological standpoint, and deserve the attention of any serious student who prefers to learn

from the work of his predecessors rather than blind Lv repeating it.

6,2 First Voynich Manuscript Study Group, 1944-46

After the debunking and rejection by scholars of the three major solutions claimed by Newbold. Feek.

and Sironc,

William F . Friedman decided to mount a large-scale effort against the manuscript with the aid of a uniquely i if accidentally >

well -constituted team of researchers. This group, made up of scholars engaged in war work in Washineton. included

i according to Elixebeth Friedman 1962) "specialists in philology, paleography, ancient, classical, and medieval languages;

Egyptologists, mathematicians, and authorities on other sciencesdepined in the manuscript." Awaiting demobilization at the

dose of their service to the Government during World War 11, they agreed to get together after working hours under

Friedman's direction and focus char talents on the mystenous manuscript.

The group was called together by Friedman in Mav of 1944, On the rwenth-sixth of May. sixteen people attended the first

meeting of what was termed an extracurricular undertaking. Friedman provided an outline of the manuscript s history

and previous solution attempts, and the attendees examined the photocopy lent to them by Dr. Petersen. Sample sheets of

copy were distributed to those present, and plans were made to work up a standard list of the symbols and a transcription

alphabet in Roman letters with some digits and special characters {punctuation, etc.) for processing on IBM punched -card

accounting equipment. Figure 19 shows the list of symbols and English equivalents they arrived at. Meetings were held at

approximately biweekly intervab through June; transcription of text and study of the script continued and various

background topics (Athanasius Kircher s work. John Dee s activities, studies of medieval Latin, etc. > were investigated and discussed.

Meetings seem to have been somewhat less frequent and regular thereafter, or at least considerably less fully documented

m the manures I have seen. Nevertheless, in September 1944 an "IBM run" had been made (on tabulating and sortme

machines, since no programmed computers were in general use at that time) In subsequent months, more text was

transliterated and machined, in December 1944. meetings were resumed." implying that a hiatus of some duration had

elapsed during which the group had not been meeting. A new enthusiasm was communicated to the attendees, and a ne*

impetus provided to their efforts (according to the minutes) by William Friedman's presentation of his findings concerning a

40

language indicated thai

word beginnings and endings, lecrer frequencies, number of different symbol*, and word lengths seemed comparable eo those

found in the Vovnich text.

During January and February, the group continued co work on IBM runs and frequent v tabulations. There is.

unfortunately, no record of their work after this time in the materials available to me. although there is evidence that work

continued sporadically into 1945 and 1946. It is hard to telL in the absence of any summary of their results, how much tc \setminus + t

they succeeded in processing by machine and what analyses they performed on it. Judging by the printouts ot machined text

rhai were preserved in our records, thev transcribed and keypunched an impressive amount of text at least -iS.QOO

characters, or 1663 thirty -character lines. The tabulations of results and any report of rhe analync studies hu\e disappeared

from the file, if they ever existed in final form. Subsequent students have had to repeat, over and over again. all the work of

transcription and machine preparation, as if it had never been done by others.

Eiiiebeth Friedman presents the following perspective on the outcome of the First Vovnich Manuscript Study Group

"Because the preliminary work of transcribing the lext into, machine- processable symbols could only be done after work me

hours, demobilization was practically complete before the manuscript was ready for final study, The scientists thereupon

disbanded and returned to their universities or research projects. Their considered opinion as eo the age. authorship and

general nature of the manuscripts, based on their extracurricular work, are still valid todav i I962>,

63 Theodore C Petersen

Father Petersen (1 883-19661 was a teacher and priest at St. Paul i College and Catholic University iThe toHomnc

details are largely drawn from unpublished biographical notes and a survey of Petersen's work on the manuscript compiled

by Tiitman afrer Petersen's death in 1966.1 He had one hundred and twenty -two sheets of photosrats made on April 29,

1931 from Mrs. Voynich's copy at a cost of \$25.00 Thereafter he spent considerable time, especially from I 952 until the

time of his death, in a painstaking and thorough study of the manuscript. His work included a complete hand copy. carefulh

corrected by reference to the original, which he examined in the New York Guarantee Trust safe deposit vault where it was

kept until Mrs. Voynich's death. A note on the front page of this transcript attests to the fan that he finished it Juh 19.

1944. Tiitman 11975) reports that the task of copying the approximately 250,000 characters of text occupied about four

rears.

Petersen was a scholar of wide learning in ancient languages and history, and compiled a quantity of valuable and

interesting information about religious, astrological, and mystical manuscripts and ocher sources of possible relevance io the

Vovnich manuscript. He also directed considerable attention toward identifying the plants depicted in the herbal drawings

The pages of his transcript are copiously annotated with these gleanings and commentaries In addition to the transcript.

Petersen made (also by hand) a laborious and complete concordance of the entire manuscript, showing every word with

reference to all the pages where it occurred and several words preceding and following each occurrence. As Tiitman suggests,

in the absence of a complete computer index, this concordance can be of great value to students of the manuscript.

in his scholarly and wide-ranging background research. Petersen studied the works of Ramon Lull and St. Hildegard or

Bingen, magical manuscripts such as Picatrrx. astrological, alchemical, and herbal writings, and the works of Albertus

Magnus and Roger Bacon. There is. unfortunately, nowhere in the material available to me am report of theories Petersen

may have held, or conclusions he may have reached concerning the decipherment of the manuscript. At his death, his papers

were given to William Friedman; they were inventoried at Friedman's request by Tiitman. and arc now a pan of the

Friedman collection at the Marshall Library in Lexington. Virginia.

6.4 Second Voynich Manuscript Study Group, 1962-1963

In 1962, Friedman succeeded in interesting computer specialists at the Radio Corporation of America in an experimental

effort to study the entire manuscript by computer. The first meeting of a new study group was held on 25 December. 1962.

According to the minutes. Mrs, Friedman presented background data on the history of previous work and general

information on the manuscript. Mr. Friedman then gave a presentation on the 'Salient External Features and Cryptologic

Characteristics of the Manuscript/' The group worked together, again "extracurricular! v" and with a minimum of publicity,

over the next several months. A small team of 'dedicated wives' 1 (as they were described by a participant in the study group/

were hard at work transcribing and keypunching a quantity of text, using facilities provided by RCA after working hours

Ambitious plans were laid for an impressive set of computer runs, intended to involve, according to the records I have

studied, at least 2000 thirty-three character records, or upward of 66.000 characters of text. There are flowcharts, program

specifications, and all the other paraphernalia of a full-scale computer attack, which (had it been completed) would certainly

have provided students with a powerful

tool for research. The computer runs planned included studies of all character

sequences fn -graphs") from one to six letters in length; single words and sequences of words in their context, the

occurrence of letters at different positions within words; words in different positions within sentences: and, finally, a study

called "le tt e r permutations' whose nature is not dear to me from the documentation. This plan would have resulted in a

complete computational- linguistic analysis of the Voynich text.

I cannot determine how many characters of text were actually machined, and whether any processing was ever completed.

There is dear evidence in the records chat programs had been written to generate the computer files required to cam out the

processing, and that detailed specifications had been set up for performing the sorts and tabulations. In September, 1963.

plans were still being pursued to complete transcription and machining of text. Figure 1 9 shows the transcription alphabet

used by the RCA group to represent the Voynich script characters. Unfortunately, the second midy group suffered the same

fate as the first: higher management at RCA decided to terminate even the minimal "extracurricular" involvement of their

resources, and the group was forced to disband before any definitive results could be obtained.

6,5 William F. Friedman

A specialist m generics and biology who became one of the world s foremost cryptologists, Friedman was also a devoted

student of the Voynich manuscript from the early twenues on. He worked with John M. Manly in resting and disproving

New bold's claims. Elizebeth Friedman (1962) provides an amusing account of the sport she, her husband, and Manly had

together in demonstrating other J 'decipherments" that could be had from Newbold s text using his methods but with

different arbitrary and subjective choices and arrangements of letters at certain stages of the process (see Section 5.1 above)

In 1944, as we have seen earlier in this chapter, Friedman brought together the gathering of war -working scholars who

formed the First Voynich Manuscript Study Group. Their work, unfortunately cut short before it could reach fruition, has

ahead y been described, Elizebeth Friedman has this to say concerning her husband's enduring interest

in the problem, which

never flagged up to the time of his death in November, 1969: "Through the years since I92L Friedman has continued to

interest scholars and cryptologic experts in the problem, besides giving it what spare time he could himself In the opinion of

this writer. Friedman's studies have produced a theory which constitutes a logical basis for an attack that may lead to a

solution of this baffling manuscript" (1962).

Friedman published a statement of his theory, in the form of an anagram, in a footnote to an article on another cryptologic

topic in the January 1959 issue of the Philological Quarterly (Friedman and Friedman 1959), At the same time, he

deposited a statement in dear English in the archives of the Quarterly's editor. He did this in order to establish and date his

claim to the idea, which he could not yet work out in detail and prove sufficiently to publish. This is the anagram, as it

appeared in the footnote: PUT NO TRUST IN ANAGRAMMATIC ACROSTIC CYPHERS. FOR THEY ARE OF

LITTLE REAL VALUE — A WASTE— AND MAY PROVE NOTHING. — FINIS." (Friedman and Friedman 1959, p

19). In his article* he sates that an anagram of this length is possible, though extremely difficult, to solve; in order to read it.

one would have to know something of what it said. In this way, Friedman planned to have a cryptographer's last word, and

thus triumph, even from the gra ve, over any later discoverer of the same idea.

The theory which Friedman concealed in the anagram has since become known to a number of students, and there seems

to be no further real secrecy concerning its nature. Tiltman had later independently reached the same conclusion (set Section

6.6 below), namely that the text of the manuscript was written in a synthetic language built up on the basis of categories or

classes of words with coded endings or other affixes, Friedman's and Tiltman's researches into known Languages of this cype

have been mentioned above, and more will be said on the topic in 6.6 and in Chapter 9.

* 6.6 John H, Tiltman

Brigadier Tiltman. a professional cryptologin of long and distinguished experience, was introduced to the elegant puzzle

of the Voynich manuscript in 1950 by William Friedman, who provided him with copies of several folios from the final

section of the manuscript, consisting of text without drawings. Tiltman quickly carried out. by hand, a thorough set of

statistical studies on the text, concentrating his efforts on the most frequent symbols and their combinations. His analysis,

demonstrating a "precedence" structure of symbols within words and the orderly behavior of characters

42

"middles/ and 'coders' of words, has remained one of (he most solid and useful findings gleaned by students of cht

manuscript during many years of study. In 1951, Tiitman prepared an informal report in the form of a personal

communication to his friend William Friedman, in which he summed up his work (Tiitman 1951k The next ft*

paragraphs will briefly review some of the salient points in that report.

Tiitman directed hii attention toward the behavior of the seventeen commonest symbols in the manuscript; figure 19

shows his transcription alphabet. He notes the ordering of characters within words in such a way char they seem to reflect

entities Like stems and affixes. Certain symbols most often begin words, and duster there with certain other symbols: others

exhibit a preference for the ends of words, where they cluster in certain arrangements with other symbols. There is j

structure of repeated "V and "C" symbols after and "0". and before ^ if*', A table of these bl-

endings \ as found by Tiitman, is shown in figure 27. He mentions also the frequent sequential repetition of \^ " in

phrases such as 1 ft? *? "■ "5? •?«£. etc., repeating the suggestion of a friend of his that these and other similar short

repeated groups might stand for Roman numerals. (for example, "*t^) " might be "iij", and J might be xxv 1.

While mentioning this idea as an interesting possibility, Tiitman points out thir it does not work out well in some cases, and

it nil! leaves us with too many unsolved problems. In any case, the ordering of symbols within words dearly demonstrated by

Tiitman. and since confirmed by others, presents us with a phenomenon which must be satisfactorily explained by any valid decipherment theory.

As he stated in his 1951 report to Friedman. Tiitman had independently arrived at the same theory about the plaintext

underlying the Voynich script that Friedman himself had earlier developed. He states this theory thus: As you know, I ear In-

formed the opinion, which you held much earlier than [.that there was no cipher involved ar all (in the common h- accepted

sense of the word) and rhat the bans was more likely to be a very primitive form of synthetic universal language such as was

developed in the form of a philosophical classification of ideas by Bishop Wilkins in 1667" (1951. p.

1). Tiitman became

convinced, from his study of the behavior of symbols within words and words within lines of text, that the phenomena could

not be explained by any simple substitution system. In pursuit of confirmation for his theory, he undertook a determined

search to trace back the concept of 'universal 1 'and "synthetic" languages to a time that might be consistent with the origin

of the Vovnich manuscript (1550 or earlier).

Fnedman. as we have seen above, had turned up two interesting synthetic language systems: one developed by Bishop

John Wilkins (1641, 1668a. 1668b). and another of somewhat later date devised by George Dalgarno (166L I 68 O 1

Tiitman studied these two languages carefully, looking for stvhsac and statistical similarities to the Voynich text. While both

systems were probably of too late a date to have been used by the author of the manuscript, they might have arisen in, or

been based upon, an earlier system that could have been so employed. Tiitman concluded that both Wilkins and Dalgarno s

languages were much too systematic to account for the phenomena in the Voynich text. He postulated, instead, a language

that employed a "highly illogical mixture of different kinds of substitution'* { 195 1, p. 2).

Looking back further in history for a still earlier form of 'universal language", Tiitman discovered a system called the

"Universal Character", devised by one Cave Beck (Beck 1657). This system looked somewhat promising, though ir was still

hardly early enough in date; it was certainly 'illogical" and "mixed" in us methods. The words of a small English dictionary

were assigned numbers from one to 3999, in rough alphabetical order, creating a crude four -digit code as a foundation for

the language. A subset of about one hundred and seventy -five common words could also be represented by three- letter

groups in addition to the basic four -digit code groups, constituting, in effect, a set of variants for these words; these special

trigraphs all began with Y or 'Y\

Code groups representing nouns in Beck s syitem were preceded by the letter $V\setminus$ and adjectival groups by the letter q"

Synonyms (e.g T1 "to think" and "to cogitate") had the same four -digit group assigned to them. Plurals were shown by an

'Y. or sometimes, an "8". after the digit-group. Verbs might have up to three letters prefixed to their four-digit group for

certain forms. The digit -groups themselves could be written also in letters, each digit being represented by a sv liable

< consonant-

vowel, vowel -consonant, or consonant- vowel- consonant). This variation, intended by Beck to produce

pronounceable forms for the code words, constitutes from a cryptographic point of view a substitution

of digraphs or

mgraphs for the digits, to provide a set of variants. Finally, because of the arbitrarily mixed letter -number makeup of words,

a separator was required to show where one word ended and the next began. Tiitman points out that the common "ending

group »r in the Voynich text could stand for a plural "s " followed by a word separator as in Beck s language.

Tiitman discovered another, sbJ] older "synthetic language" proposal by a man named Johnston, developed under the

direction of a Bishop Bedell about 1641. No detailed description of this system has survived, unfortunately In Chapter 9.

more will be said about synthetic and universal languages in general. I will also present, in Section 6.10 below, my own

43

Ι

findings in tracing the evidence for the existence of similar synthetic languages or codes back considerably earlier— perhaps

well into the fifteenth or ar least mto the early sixteenth contury.

In later reports (1967. 1968. 19751. Ttkman describes his other principal line of research on the Voynich manuscript. He

spent some time in England in 1957 consulting experts on early herbals and medical manuscripts, and attempting to track

down in origin for the plant illustrations. He presents an excellent overview of the history of early her bah and botanical

illustrations f 1 967. 1968). Summing up his own end others failure to discover any dear parallels to the Vovnich

manuscript, he lays. To the best of my knowledge no one has been able to find any point of connection with any other

medical manuscript or early printed book. This is all the stranger because the range of writing and illustration on the subject

of the plant world from the early Middle Ages right through into the sixteenth and even seventeenth centuries was veri

limited indeed. ... In general, the illustrations in the early printed herbah are limited to two or three collections of su lked

woodcuts copies over and over again in more and more degenerate form" (1 968. p. 11).

Aside from the substantive contributions Tiitmans research has made to our knowledge of the manuscript, another

important result of his work should be mentioned. Over the many years of his association with the problem, he has served as

a coordinator and contact point for students interested in the manuscript and desiring information about

the text or about

studies carried our on it by others. His papers and presentations have provided many researchers with a full introduction to

the subject, and have motivated a number of students to take up an interest in the manuscript. It should be evident to am

reader who has persevered this far in reading this lengthy monograph that the puzzle of the Vovnich manuscript presents a

complex challenge, and can best be approached by cooperative research, building on the earlier findings of others as in am

orderly scientific enterprise. Tikman's publications and communications have provided such a foundation on the basis of

which newer scudenu can advance, without being forced to exhaust their resources needlessly repeating all the work that

others have already accomplished.

6.7 Jeffrey Krischer

Knscher. a man of very broad interests and talents comprising mathematics, computer science, medicine, and cryptology.

became interested in the manuscript and made a computer analysis of the text as a research project during his graduate study

at Harvard University This research was described in a paper which received a limited circulation at Harvard and am one

students of the manuscript (Krischer 1969V In Pan 1 of his paper, Knscher provides a brief sketch of the earlier solution

claims by New bold. Feely, and Strong, and reviews some general information about the history and background of the

manuscript. In Pan II. "Statistical Analysis." he presents an interesting discussion of the problems involved m arriving at a

transcription alphabet and a description of the alphabets used by Newbold. Currier, and Tikman. He suggests and describes

several srylostaristical techniques which might usefully be applied to the Vovnich text.

Krischer 's approach eo the computer study of the manuscript is uniquel v interesting because he employed a special package

of programs developed for machine processing of Chinese characters on the Digital Equipment Corporation PDF-1

computer. As Krischer states, this set of programs was general enough to permit its application to the Vovnich script symbols

The symbols (following Curriers alphabet) were drawn on a cathode ray tube "scope" display attached to the PDP-1

computer. The text "could then be transcribed by pointing with a light pen to the corresponding character on the scope for

each character of the script" (Krischer 1969, p. 4). This method of transcription was more direct and convenient than the

laborious hand copying and keypunching required by other computer studies. The PDF- 1 system also permitted convenient

editing and correction of the transcribed text from the scope. The output of computer runs could be processed on the

Strom berg -Carlson 4020 equipment to produce a graphic reproduction of the Vovnich characters, thus avoiding entirely the

cumbersome and distorting artificial Romamzationa that all ocher students have had to resort to. The Vovmch text could be

fed directly into the computer, where it could be subjected ro any desired manipulation or statistical analysis. Approximately

two percent, or 5500 out of the 250.000 characters in the manuscript, were machined by Knscher in this wav. according to

his own statement ip. 53). His frequency counts are shown in figure 28: it may be noted that they add up to about 6200, a

discrepancy for which I can find no explanation.

In Section III of his monograph. Krischer discusses some statistical tools for comparing different samples of natural

language text. He selects three such techniques as potential Jv useful in comparing the Voynich ten to samples in known

languages. These statistical tools are: 1) a statistic or "characteristic" * V, describing the degree of compactness or economy

in the sequences of characters m the text; 2) a statistic representing the "entropy" or degree of "orderedneu" in a body of

text, having a characteristic value for each natural language; and 31 Markovian analysis, a way of studying the probability

that any particular letter will be a successor to any other particular letter in a string of text. Knscher suggests that these

measures, which have proven effective in other srvlostatistical researches, may be useful in helping us to determine the

44

underlyinc lanpuaje of the Voynich text. (In this approach, he assumes first, that the method of Concealment or

encipherment has not obscured any of the charanenstics of natural lancuajte plaintext, and. second, that j recogniajbic

natural language does, in fact, underiv the text. As we have seen in Section 4.4 above, neither of these assumptions can be

taken for granted, and in fan. thev are both counter -indicated by much of the evidence, as noted by Tiltman. Eiuebeth

Friedman, and others. I

The "k' statistic and the 'entropy measure were computed by Knscher for characters and for words of the V ovmch text

sample he machined He states, however, that these are of no use without parallel measures for Latin or other natural

language text for comparison. He also considers his own text sample much too small for the useful application ot the

'Markovian Analysis' method, which would, he states, require at least five times as much text, or 25.000 characters. At the

time of writing his paper. Krischer planned to carry out further studies; I cannot find any record of am subsequent results

however This promising and interesting computer project, which pointed out a way of testing some important hypotheses

about the ten. seems to have been terminated, like so roanv of the others, before it came close to achieving am useful results

6.8 Prescott Carrier

Captain Currier* a prominent professional eryptologist and close associate of Friedman and Tiliman* participated in their

researches and became an enthusiastic student of the puzzle, Tiltman f 1 97 Si sums up Curriers recent work on the

manusc ipi as follows: "Since his retirement - . seven years ago Captain Currier has spent a great deal ot time ptrtormim: hi*

own an J vies of the manuscript He holds the view that there are at least mo different handwritings which he calls A and B

In every case the two sides of a leaf recto and verso are m one and the same hand. Further his analysis shows that chert

are significant differences in their content* as in the frequency of symbols associated with one another in words When I

came to prepare this lecture.] saw at once one difference between the content of the A and B pages which convinced me In

his account of suffixes following a number of the common roots the suffix 8G lorgj $^{\wedge}$ 1 occurs eight times to rwemv-tive A

pages and 334 times in twenty- five B pages. ".Mv own feeling is that the two 'languages" express different applications

by two scribes of the same rather loose set of rules to similar texf\

Currier was able* in 1973* to have computer studies made comparing two careful l v-chosen matched samples of text* one in

hand A and the other in hand B* both selected from the herbal folios. The results of the snidv clear! v demonstrated

significant differences between the samples. In the course of subsequent hand studies* Currier has arrived at a number or

further conclusions regarding the contrast between material in hands A and B. and he is still pursuing this productive line <>i

investigation He has extended his studies to other sections of the manuscript in addition to the herbal folios His work is

documented in four unpublished papers (Currier 1970-1976* D'Impeno 1976k

6*9 Some Comments Regarding Computer Methods

The subject of computers as tools in huma rustic research* and specifically m the attack on the Vovmch manuscript, is one

rhat holds a special interest for me since 1 am a computer programmer by profession and my academic background is in

classical philology There are several wavs the computer can aid in the study of the Vovmch

manuscript* as in other* similar-

text 'processing undertakings. These arc; 1) a data processing function, permitting the marupuJation and organization of text

in larger and more significant sample sizes than can be dealt with by hand* 2) an exploratory data reduction function.

allowing us ro apply various indexes* counts* and other selection* display, summarizing and tabulation techniques, in order to

explore the data and show up any patterns or regularities it may contain as an aid to hypothesis searching; and 3) a

hypothesis -tasting function, for investigating various specific theories we may have developed as a result of hunthes^ or

from exploratory hand and machine studies.

Most of the use of computers by students of the manuscript falls in the first (data processing! and second (exploratory data

reduction) categories While these are both useful and neceisary in their place* the third use of computers, in systematic

hypothesis -testing, seems in mv opinion to be the most powerful and the most Iikelv to produce solid and meaningful

contributions to our knowledge of the problem. A significant example of this effective use of computers is Prescott Currier s

recent study of hands A and B* discussed in the previous section. Gurnet had developed his idea about hands by visual

inspection of the manuscript before he came to the computer specialists to seek their aid* He had a definite hypothesis, which

l will presume to paraphrase as follows: "If* m fact* there is a real and significant difference between the text in the two sets

of pages that look different to me. then they will have different distributions and clusterings of characters." Accordingly, he

requested only certain carefully- planned machine runs, to be made only on rwo matched samples of text chosen so as to keep

other variables constant in so far as was possible. The computer runs riearly confirmed his theory, demonstrating the

45

differences he had postulated between the two samples: a result that might never have been obtained through any amount of

machine processing applied indiscriminately to masses of unselected text.

In mv opinion, this is the best wav the computer can serve us at this stage in our research on the manuscript. All the more

obvious and easier data processing and data reduction displays have been made again and again by various students, with

disappointing results. It seems evident that, if anything new is to be learned from computer runs, we must perform some

more carefully -planned selection of the data, or some more specific and sophisticated manipulations

such as would show up

concealed patterns in the internal structure of words and sentences, in response to a particular theory regarding the

crvptologic nature of the text, or some theory about its possible content or provenience. It is all too easy to plug a way at

machining more and more data in very general ways, with no guiding principle for selection and interpretation Our abilities

to process data by machine today frequently far outrun our planning and imaginative capabilities. We are likely to end up too

often with many feet of printouts that tell us little or nothing, since we still have no meaningful questions to ask. One of the

most demanding aspects of scientific work is the framing of useful questions, and the design of experiments that will produce

useful answers. We need to apply this scientific approach to our study of the manuscript, and especially in our use of

computers. In hand studies, the limitations of patience and a me on the part of the investigator effectively preclude many of

the more wasteful activities, or at least prevent their assuming wasteful proportions, but the computer permits us to transcend

these limitations and. alas, to carry out wasteful activities on a grand scale.

46

Chapter 7

Collateral Research: Roger Bacon (A.D. 1214?- 1292?)

The necessarily brief and sketchy review in this chapter cannot approach an appropriate treatment of the remarkable

thirteenth -century scholar whose name his so frequently been associated with the Vovnich manuscript. As mai be seen trom

the discussion of Bacon's possible authorship of the manuscript in Section 2.2,2 above, there is no solid evidence eirher

supporting or denying his connection with the work, however indirect. Nevertheless, anvone interested in rhe manuscript,

find, indeed, anvone who cares about the history of Western thought) should learn as much as possible about Friar Bacon, it

only because he was so evidently a man worthy of closer acquaintance. He is especially appealing to the modern reader lor

would be, if his works were made more accessible) in chat he has told us. in a forthright and ingenuous manner, so much

about himself in his own writings; in fact, almost all that is known about him today originates in his own words, since his

contemporaries rarely, if ever, mentioned him in surviving records. Bacon's own voluminous writings, and the many and

varied specialized studies of his life and work made by scholars of the nineteenth and twentieth centuries, afford a weairh of

insight i.ito those problematical relationships between wisdom and science, God and Narure, human value and objective

technology, which still confront us today, however we may attempt to disguise them by recasting chem into modern larcon

7.1 Works By and About Roger Bacon

Bacon \$ life and works have been described and analyzed in a number of mayor studies, though I believe ir is still fair ro

say that, up to the present, no truly complete and definitive treatment has been attempted. Few of his writings have been

translated into any modem language; much remains unedited and unpublished even in the original Latin. Bacon himself

exacerbated the problem by reworking and re-using his writings over and over again, so that it is hard to tell which of the

many fragmentary works that survive are copies or revisions of parts of other works, and which are separate compositions

The condemnation of his doctrines by the Franciscan Order, and the resulting suspicion and fear on the part of later w riters,

contributed to the confusion, since many scholars quoted or copied his works without daring to mennon his name As a

consequence of these many obscurities and difficulties. Bacon's works are not all accessible to the modern reader, with the

sole exception of a translation into English of the Opus Majus (Bacon 1928b).

Scholarly studies of Bacon's writings have been carried out primarily from very specialized and narrow points of view At

one extreme, historians of science have been interested in Bacon as a part of their search for precursors of modern objective

experimental methods: at the other extreme. Catholic philosophers and scholars have examined his pronouncements on

various technical points concerning medieval Scholastic philosophy. Emile Charles (18611, despite the early date of his work,

provides a remarkably clear, fair, but sympathetic general presentation, expressed in elegant scholarly French and bolstered

by a quahty of learning formidable in its thoroughness and dedication. A careful reading of this enjoyable. humane book is

recommended as a starting point for anyone interested in Bacon. Later writers are indebted to Charles for much of the

information presented in their volumes and for much of its interpretation as well. A much more recent book by Stewart C

Easton (1952) is also to be recommended unreservedly; his approach is remarkable in its imaginative use of historical

analysis and its creative extrapolation from the few available facts to develop a striking picture of Baton * personality and a

clear perspective cm his thought. James Blish (the well-known Science Fiction writer prominent in connection with the Star

Trek series) has written a very fine fictional biography (1971), based primarily on Easton's study of Bacon, which I also

recommend to the interested reader,

I have attempted to obtain and read every serious work concerning Roger Bacon which I could find, in an effort to gain a

fuller understanding of his contribution to knowledge and his possible association with the Voynich manuscript. The

bibliography appended to this monograph, (while it cannot claim to be exhaustive, and does not even include all the works I

have examined, since some appear likely to be of Little value to the reader primarily interested in the Vovnich manuscript!,

should provide access to most of the major works on Bacon in English as well as many in other Western European languages.

47

7.2 Bacon f J Life and Works

Bacon spent most, it nor all. of his adult life as a scholar or teacher. He studied and then* having completed a Master of

Am Decree, taught at the Universities of Oxford and Paris in the 1230 s and 1240 s. The newly rediscovered works on

natural philosophy by Aristotle occupied a central focus of intellectual excitement at the time. Aristotle s works had been

preserved among Mohammedans along with other sources of Greek learning* while they were forgotten by a Europe

immersed in rhe barbarism of the Dark Ages and the obscurantism of the early Church: translated into Latin and

accompanied by a wealth of commentary by Mohammedan and Jewish philosophers* these new weilsprings of early Greek

science brought about an intellectual revolution in thirteenth -century Europe. The task of attempting to resolve the basic

differences between the philosophy of Aristotle and his pagan commentators, on the one hand, and the ami -intellectual,

other-worldly viewpoint of the Church Fathers forming an integral pan of Christian doctrine, on the other hand

preoccupied the attention and strained the resources of thi net nth -century thinkers.

Bacon was one of the first scholars capable of lecturing on the newly, revealed Aristotelian Natural Philosophy and Arab

commentaries. He was evidently a good teacher, and must have enjoyed his years at the Universities. A voluminous

manuscript, apparently representing a student s long-term collection of notes or transcripts of Baton s lectures on various

works of Aristotle, covering several years, has been edited by Steele {Bacon 1909-1940). Another manuscript, also

described by Steele (1933). represents notes by a student in other, much more elementary courses on geometry. arithmetic,

and similar topic v given by Bacon.

At some point in his University studies. Bacon suddenly seems to have changed the course of his thinking, turmne aw j\

from the promising and rather successful career he had been making for himself as a teacher, he apparent! v took off on *i

course of self-study, seeking out obscure scholars interested in the 'natural science' of the day akhemv. astronomy, and

astrology He became particularly preoccupied with "expert memurn": an approach to nature that involved the collection and

systematic comparison and analysis of other s reports on natural phenomena* along with a son of informal tinkering or trial -

and -error investigation of phenomena in order to understand them better. The "sdentia experimental is' of Roger Bacon was

not at all like our modern, controlled laboratory experimentation, with its vast armament of equipment* procedures, and

models: nevertheless* is had the same fundamental orientation toward the external, objective world, and the same motivation

in open-minded curiosity. Bacon also began so place great emphasis on knowledge of languages other chan Latin, m

particular Greek. Hebrew, Arabic, and other original languages of the Bible and the Greek and Arab philosophers, regarded

by Bacon as the sources of wisdom revealed by God.

Bacon wrote extensively on a variety of topics, notably on optics and the transmission of light: geography: astronomy and

astrology; language, translation, and Biblical criticism; the reform of the calendar and of education: medicine: and akhemv.

A prominent feature of his works was an emphasis on the utility of these arts and sciences for the salvation of man <md the

good of the Church. He was. first and foremost, a "mission oriented' thinker, and constantly reiterated the meaninglessness

of any knowledge without a moral goal and frame of reference. For him. rhe motivation of science and learning was to be

found in the mission of the Church. He asserted the methodological unity of science, philosophy. and religion, and was

interested, to a degree unusual for his time, in methodology as such. It is interesting to note, also, that Bacon spoke as often

and as insistently of the "beauty" of philosophy and science as of their utility f for example, in an appealing and characteristic

phrase quoted by Frankowska (1971. p. 36), from Bacon's CommunU Naruruha . he says he wishes to compose a treatise on

Perspective quia hcc est pukhrior alii*... because it is more beautiful" than other sciences)

Some rime in the 1 240's Bacon decided to join the Franciscan Order, for reasons he never discusses in hts works. Many

scientifically-oriented modern writers have speculated about this course of action, which appears to many of us. from our

distant land often irreligious) viewpoint, to have been a fatal mistake on his part. He never seems to

have gotten along ven

well with his superiors, and incurred some degree of discipline or confinement on at least two occasions (on the nature and

severity of these punishments, sec Fcrei 18911. In 1267. he was asked by Pope Clement IV to send copies of his

philosophical writings to Rome, and in response, produced the Opus Maps. Opus Minus, and Opus Trrttum \ his three besc-

known works). Clement s death in 1268 destroyed any hopes Bacon might have had of achieving recognition and support for

his educational and intellectual reforms, although he apparently made several subsequent attempts to write a Stnptum

PnrtcjpaU. or encyclopedic work on human knowledge, that was probably never completed. Again imprisoned or severely

restricted by his Order in 1278. he produced little further until his death in 1292 lor* some claim* 1294). Lists of Bacon %

extant writings and fuller treatments of his biography may be found in Charles (1861). Easton { 1932 1, and Little i I 892, 1914).

48

7.3 Survival and Significance of Bacon's Work in Later Times

The thirteenth -century Friar Roger, a: has been noted by jevera! writers, has been overshadowed and submerged in the

far ^rearer acclaim accorded by our age to his namesake, Francis Bacon, who is credited with the invention o t mender n

scientific method. Roger Bacon seems to have been regarded by many recent writers as a sort of exasperating enigma; he

stubbornly refuses to be stuffed into any of their favorite pigeonholes. Scientific writers are impatient with his expert mental

science" because he did not provide diagrams and specifications of his constructions and laboratory equipment as a present -

day scientist would be expected to do. Students of Scholastic philosophy find him an indifferent philosopher, and his name i *

omitted entirely from a number of modern survevs; in others he is passed over with a few ambiguous sentences Sharr

\ 1930) provides a dear and not overiv favorable examination of Bacon's positions on various typical Scholastic questions, m

comparison with a number of his other, more conventional, contemporaries, Manv writers seem unable to decide whether

Bacon was a religious mystic on the one hand, or an iconoclastic positivist and empiricist on the other.

Roger Bacon's main difficulty was undoubtedly his inability to be a "team player he did not ally himself wtrh any

school of thought accepted in his time, and in fact launched violent and outspoken attacks upon most of

his better -known

contemporaries. He frequently referred to them as a "stupid crowd/" and castigated them for their "stuiticiam infinitum,

this uncompromising combativeness was probably the real cause of his condemnation, however it may have been

rationalized. He was apparently trying to articulate ideas for which his own age had no words, nu predilection, and n<«

understanding; our age has dearly swung so far to the opposite, positivistic pole that we have even less real sympathy aru;

comprehension for the synthesis he was trying to form. Bacon went his own wav. building his own amalgam of faith, mai ik

philology, and natural philosophy based on Greek, Arabic, and Jewish writings and borrowing from a very small number 01

living colleagues (Robert Grosseteste. Adam de Marisco, Peter de Maricounh He rejected the Scholastic Method developed

by Peter Abaelard. in favor of his "scienda experimemaitsT and he minimized the importance ot logic and verbal

disputation, so dearly loved by his contemporaries. On the other hand. Bacon's "experimentum' included the study ot

reported "experiences" of the Greek and Arab philosophers, comprising fables and superstitions concerning such things as

the virtues of viper's flesh, the influences of the stars, and flying dragons; stranger still to the modern mind, his

"experimentum" included Divine illumination and mystical insight from God. Thus, Bacon succeeded at the same time m

alienating all of his colleagues in his own time, and m confounding all of his would-be admirers in our century as well.

Condemned by his Order and prevented from writing or teaching. Roger Bacon was marked out tor oblivion by his

superiors and fellow scholars. His voluminous works were apparently ignored, but exploited indirectly and in hidden wavs b;

his immediate successors who feared to mentioned him by name His name was apparently even erased from some copies of

his works Bv the end of the fourteenth century, however. Bacon began to enjoy a gradual revival or emergence of sorts. H \setminus

work on medicine (Bacon 1928a) was transparently pirated and plagiarized to good effect by some later medical writers

This, together with his Eptstoia de Mirahili Potestatt Artis et Naturae (Bacon 1859 », and several garbled and spurious

alchemical works (Bacon 1603; Singer 1932) were quite popular, and served to provide the Franciscan Friar with 4

formidable reputation for vast occult powers, John Dee was a devoted disciple of Roger Bacon, and did much to bring about

a new Renaissance of his reputation and writings. It has been suggested that Francis Bacon was introduced to Roger s works

at Mortiake. Dee s home, through the extensive library of Bacon s writings Dee had lovingly and assiduously collected Sony

have even gone so far as to suggest that Francis was far more indebted to "a certain monk in a cell"

than he ever admitted.

From the late 1800 s on into the early twentieth century. Bacon had another revival, being hailed as a martyred

forerunner of modern experimental science and technology. Much was made of his predilection for "experimentum . and hi*

emphatic rejection of the ideas and methods of his contemporaries. Newbold's claim to have deciphered the Voinich

manuscript, and to have discovered evidence there of Bacon s invention of the telescope and microscope, came at the crest of

this wave and added briefly to its momentum. Catholic

writers hailed the Newbold theory as a "vindication of thirteenth

century science " (ReviHe 192 L Walsh 1921). Rudvard Kipling wrote an interesting short story called The Eve of Allah

m which Roger Bacon was a central figure (Kipling 1926; I am indebted to Brigadier Tiltman for pointing out this story tu

me). Typical of the effusions of some considerably less gifted writers is an article by Grove Wilson in a popular survey called

Great Men of Science i 1942); overflowing with pathos for the persecutions visited upon Bacon s "scientific" genius by tht

witch-hunting Church, this embarrassingly dreadful dose of purple prose even credits Bacon with the invention of the steam

engine in his "laboratory,"

Predictably enough, the pendulum swung rapidly to the other extreme, aided considerably by the debunking of New bold s

theory by Manly and Friedman Lytm Thorndike (1916. 1921. 1929, 1923-58) went further than most in attempting to

divest Roger Bacon of any claim to respect as a philosopher or a scientist. In Thorndike s monumental work. The History of

49

Vltfjpfi' and Experimental Science *1923-58'. he dismisses Bacon as a superstitious medieval monk, a believer in map C,

completely devoid of inv trace of the modern scientific outlook, and thus not worth v of the attention ot modern thinkers

While he deals almost as harshh with all the medieval writers he discusses in his work. Thorndike s debunking of Baton

seems to be a shade more savage and thoroughgoing. undoubted Iv in an over -reaction to the effusive and misplaced adulation

of Bacon by some earlier writers

Steele (19211 provides what seems to me to be a very fair estimate of Bacon's place in history; he is supremely well

qualified to assess Bacon s works, having edited more of them than most other Baconian scholars. He offers the following

perspective, based on Bacon's stated plans for his unfinished Scrrptum FrinapmU "In estimating Bacon's position among the

men of his own time it is important to remember, first of all. the complete originality of his scheme. His great work,

unfinished though it most probabh was . . , was as distinct in kind as in form from the works of his great

contemporaries Bacon s schematic arrangement was nor onh unparalleled among the writers of his time: it was

absolutely new Nothing like it had been devised since the time of Aristotle. . The whole syseem of human thought was

recast, ... It may be that the framework of his scheme owed something to Al Farabi s Dt 5c/>iacii>. or to Avicenna, but in its

conception and execution its originality is manifest" Ipp. t4 1-142).

A very interesting recent study by a Polish author, Malgorzata Frankowska 119711. presents a very favorable, vet fully

documented and supported assessment of Roger Bacon's contributions to knowledge and his influence on the development of

modern thought. She provides several detailed examples of Bacon s approach to empirical science; his treatment of the cause

of rainbows in ti e Opus Map* j, for example, clearly supports a conclusion that he fully shared many of the systematic and

analytic mental habits of the modern scientist (Frankowska 1971, pp. 85-87; cf Bacon 1928b. pp. 5S 7 615). Though the

equipment, the data* and the sources at his command were woefully deficient, he used the reports of others and his own

carefully -planned observations in a dosely -reasoned, orderly manner to eliminate various competing hypotheses and io build

up confirmatory evidence for one particular explanation of the observed and reported rainbow phenomena.

It is interesting to note that, in spite of his later explicit rejection of the Scholastic Method. Bacon made extensive and

e x pe n use of it in his earlier lectures f 'Quaesoones ') on Aristotle, and he was evidently a skilled master of this highly-

developed form of analytic disputation (see Steele 1933). At the heart of the Scholastic Method was an arrangement of data

(constating* typically* of quotations from Biblical and Patristic authorities and from Greek and Arab philosophers) so that all

those sources favoring and those opposing a given point at issue were matched in an orderly way, followed by a 'solution' or

' resolution' attempting to reach a conclusion from all the evidence. This method, when ikil fully applied to valid data, was

and sail is a powerful tool of analysis, and differed essentially from modern scientific thought only in its raw materials

[quotations from "authorities ' rather than empirical measurements) and its purpose (the resolution of religious and verbal

rather than technical and empirical questions In his analysis of the rainbow. Bacon put to good use the

best features of the

Scholastic Method as applied to the strongest and best data he could obtain

Roger Bacon's principal contribution to knowledge, according to Frankowska. involved the nature and methodology of

science. Rejecting the presentations of ocher writers* which she regards as onesided (even m the case of Easton, whose view

of Bacon she sees as overemphasizing the religious and mystical side of his nature)* she assesses Bacon s accomplishments in

the following considered tribute: "Bacon was the first to consider in such a large w*y the theoretical problems connected

with science, he was also the first who had the vision of the utury of science* based on the units of method and

purpose Moreover, he was the first to originate theoretical reflections concerning the nature of science and its

aims—reflections which were to find mature expression much later* m the time of Frauds Bacon and Descartes, . . (p

134). She concludes chat "The thought of Roger Bacon lies at the source of both the empiricism of Francis Bacon and the

mathematical method of Descartes (p. 136)* and recommends* as have other scholars before her. a systematic historical

study to demonstrate and prove the influence of Roger Bacon s writings on the better -known later thinkers.

Until his works have been edited, translated, and systematical I v studied as a whole, on their own terms and against the

background of his known sources and contemporary thought* no definitive evaluation of Bacon s contribution to human

knowledge is possible. He remains, for most moderns as for his own contemporaries, an enigmatic and recalcitrant figure

who determinedly refuses to be filed away in any convenient cubby -hole.

7 A Was Roger Bacon Associated With the Voynich Manuscript?

Coming now to the question of Bacon s possible authorship of, or connection with, the Voynich manuscript, what* if

anything, can we concluded I feel, although! cannot support mv view with anv definite evidence* thai his authorship is

highly unlikely, nor only because of the great disparity of dates between Bacon's life in the thirteenth century and -the

probable origin of the manuscript to the fifteenth or sixteenth century. J base my opinion also on the impression I have

50

gained from a careful study of what is known about his life and his writings, including an attempt i necessarily rapid and

inadequate) to sample his own published works m the original Latin. I feel, in sum. chat Bacon was nor a man who would

have produced a work such as the Vovnich manuscript, even during his periods of imprisonment or persecution.

Far from being a rebel or iconoclast in any modern sense. Bacon was clearly a deeply, even passionately religious man who

accepted the beliefs of his Church. He chose to become a member of the Franciscan Order, and chose to remain within it for

the rest of his life, in spite of repeated harassment* and disappointments. He claimed repeatedly that the only purpose of

human knowledge was to serve God. uphold the Catholic Faith, convert unbelievers, and defeat the evil power land

technology!) of Antichrist. He was also fascinated, as we have seen, by mathematics, methodology, and inductive reason,

however inadequate the data and techniques available to him may have been

Bacon, in short, does not seem to me to be the sort of man to have created a magical manuscript, so provincial in sryle. m>

ambiguous and curious as the puzzle before us. Almost al) of his authenne writings that have come down to us are clear,

scholarly treatises in medieval Latin, quite uncompromising in their forthright and rational quality He was skilled m

draftsmanship, and trained assistants in' the computation anddrawing up of tables and diagrams. In none of his extant works

is there any indication of a real personal interest in biology or botany, although he praised, in passing, the usefulness of

agriculture and husbandry. His medical work was a faithful and complete compilation of information about medicinal plants

drawn from other authorities, and not original with him. His approach to astronomy, astrology, and alchemy was abstract

and conventional, oriented toward methodology and terminology; it provides no frame of reference within which we mi eh:

understand the Voynich manuscript s idiosyncratic Zodiac diagrams and other drawings decorated with female figures and

symbolic pipes, "cans.' and tubs.

It seems to me much more likely that the Voynich manuscript is a product of the sixteenth century, probably related to

alchemy, and perhaps, as suggested by Brumbaugh, ascribed to Bacon because of his reputation for occult learnings, < Anv

otherwise unidentified, mysterious manuscript was apt, in the past, to be attributed to Bacon, especially if it concerned magic

or alchemy and was provided with bizarre diagrams.) Rather than ascribing such a work as this to a fastidious, essentially

conservative, and learned man such as Roger Bacon, I can far more easily imagine a small heretical society of Hermetic

adepts and illuminab. perhaps in Germany or Eastern Europe, concealing their strange and probably dangerous doctrines in

a

secret book of the kind we see in the Voynich manuscript, I urge the interested reader to explore some of the works on Roger

Bacon listed in the bibiiography at the end of this monograph, and. especially, to read some of Bacon s own works 4 if on ly

the Opus Mafuj. the sole work accessible in English J. and thus reach his own conclusions.

51

Chapter 8

Collateral Research: Medieval and Renaissance Cosmology and

Iconography

The rtmainim: chapters in this monograph art intended to provide a very broad 'brush survey of some background topu*

that may be relevant to the problem of the Vqvnich manuscript As we have seen in Chapter 2, it seems probable in the eve-'

of mans students that she manuscript can be dated to late medieval or early Renaissance times, and is ut European

provenience, k seems, therefore, char any sertotre student should gain some understanding of the sciences philosophies

methods of representation, and other features of those periods that can put into proper Conte*: the phenomena in the

manuscript itself, and perhaps give us some leads roward an interpretation of the drawings and the purpose and motivation

of the work is a whole. I urge the reader 10 consider the present sketch v treatment as a mere appetizer. a sampler nr mhiic

very beautiful and curious prod nets of human art and wisdom that have survived the iconodasm and neglect ot relit u»l*

reaction on the one hand, and scientific positivism on the other

8, Ars Memorativa: The Art of Memory

Probably the best and most genera* treatment of the Art of Memory is that of Yates \ 1906;. Much of the presentation

below is taken from that excellent study. and I recommend the book to any reader who wishes to learn more. In the lung aces

before pencil and paper became the trusty and abundant companions of every scholar and bureaucrat, other means had to bt

found to organize and remember the details of complex presentations such as legal cases and public speeches Orators,

philosophers, lawyers, and statesmen of ancient Greece and Rome prided themselves on their highly

developed visual

memories, which were so cultivated and emphasized as to be virtually eidetic m character An important Latin stiurct in tilt*

tradition tor the Middle Ages was the Ait Htrtnntum, attributed by medieval writers to Cicero \ Tullius' . chi* work

described a mnemonic svirem supposed I v devised by Simonides of Ceos \ BO. and regarded as a vital part of the

Art of Rhetoric.' itself an essential feature of ancient and medieval education.

In the memory system ascribed to Simonides, the orator went to a quiet, well -lighted place such as a large build me a

forum, or some other structure provided with a series of distinct niches, columns, stairs, or other order iv architectural a no

scenic elements. He walked about there, systematically rehearsing the ideas of his presentation, and tocussmc his attention

upon the successive scenic units so as to associate with each a kev word or sentence of his speech, in conjunction with some

w-eird. striking, and colorful visual image that would serve to remind him of the ideas later in their proper sequent The

memory images" were to be chosen from such sources as Greek and Roman mythology and legend

This system of place -memory 'gave us our modern word 'topic/' from the ropoi or places constituting its mam

feature, (The medieval Stations of the Cross which have survived mto current Catholic usage today provide an example ot a

place-memory system associated with vivid visual imagery). Greek and Roman orators boasted ot the capacity of their

artificial memories \ and competed to see who could remember the longest senes of words or ideas — well into the

hundreds and thousands — by means of such mnemonic methods. In addition to the Ad Htrenntum . another work, also by

Cicero. De Orarore, described a similar memory system. A work by Quintilian, dating from the first rentury AD. pro v idee

dear directions for choosing Memory "places ' and constructing images to be stored in them and associated with the ideas

one wished to memorize.

With the advent of Christianity, the Memory An became a major resource tot preachers and religious educators in their

spreading of the Christian Faith. Of the rwo great mendicant Orders of the Middle Ages — the Dominicans and

Franciscans — each had its own favored Memory Art for preachers. The Dominicans employed the classical art as described

above, with colorful images drawn Irom pagan mythoiogy and other barbaric foreign sources * in a manner which often

seems to us startlingly and amusingly inappropriate i as mnemonic tags for Christian teachings.

The Franciscans followed a different tradition instituted by Ramon Lull i A.D L235- 1315>. a

flamboyant and innovative

personality whose life and works are well worth studying for their own intrinsic interest isee Peers 1929. Yaies I Mon.

and 1966 pp, 173-198: Rossi 1961). Instead of using images. Lull s art employed a set of revolving circles ur other

od

Ι

simple geometric figures marked with letters of the alphabet, which were manipulated in a combinatorial fashion The rinu*

or other elemems were rotated against each other to produce all possible combinations of the letters, which could be made tu

stand for ideas such as L 'God'\ ' Evil". € 'Man'\ "the Soul *; for lists of sms and virtues: or for anv set of concepts nr

elements one wished to remember and meditate upon in sequence Lull, a 'native of Majorca, was probably influenced by the

mystical Jewish tradition of the Cabala (see 8.7 below) and also by the Mohammedan mystical philosophy or Sufism h is

interesting to note that Lull's combinatorial method of systematically listing and considering all possible combinations ut a

few basic elements is a very powerful and valuable mental tool. Shorn of its medieval and religious purposes it survives mtu

modern logic and science, and is useful to computer programmers, for example, in analyzing events in data or elements of 4

problem f I made use of it for the scheme of crvptanalytic hypotheses in Section 4,4,2 L It also undoubtedly inspired j number

of cryptographic devices involving rotating discs.

The great Divtna Commedta of Dance, and the iconography of medieval cathedrals with their 'sermons in stone art ruo

striking embodiments of the encyclopedic Memory Art. still valued by and familiar to educated people today In the

Renaissance there was a great efflorescence of richly elaborated mnemonic systems, Giuho Camilla tA.D 1480'-I5 -i 4*

built a wooden memory "theatre" embellished with colorful images and provided with drawers in which scripts ot speeches

and other papers could be filed, using a "place" system of memory, the images represented such things as the planets, tht

Cabalistic "Sephiroch." names of angels, and ocher magical and mythological elements. Giordano Bruno A.D

1548-16001 haf entered the Dominican Order and studied their Memory Art: leaving the Order later and embarking upon

a career as a Hrrmetic Magus i which Led ultimately to his death at the stake i. he continued to be

detply interested in

mnemonics and taught hts own elaborate mnemonic sysrem to wealthy parrons as a way of earning a livinc. His system, a*

reconstructed by Yates H966, pp. 199-230) from Brunos work De Umbris idearum (Bruno 1582), involved 4 uwni

memory wheel which had thirty mam segments, each subdivided into five smaller ones, the w hole arranged on the plan ot

Lull's figures so that rings within it routed independently.

The mam segments of Bruno's wheel were labelled with twenty-three Roman, four Greek, and three Hebrew letters tor a

total of thirty. Each of these could be combined with, or subdivided among, segments for the five vowels to product

combinations Aa. Ae, At, Ao, Au. Ba. Be, etc. Images shown within the segments and associated with them on various nncs

of the wheel represented elements such as the thirry-six decans (see 83 below), the seven planets, twenty-eight mansions ot

the moon, plants, birds, animals, stones, metals, etc., in a vast and all-embracing synthesis. This conception was not intended

to be merely a memory device: it was basically a system to permit the operator to attain encyclopedic philosophical

knowledge coupled with the magical powers of a Hermetic Demiurge Bruno founded a mystical sea in Germany called the

Giordanistf: their beliefs were probably akin to those of the later Rosi crucians and Freemasons. John Dee was an admirer

of Bruno s philosophy, which was in many wavs similar to hts own. The mnemonic an had a last magnificent echo in the

work of Leibniz, in his design of a set of "notae" for use in a "universal calculus. The medieval and Renaissance Mem or \setminus

Am undoubtedly formed the conceptual foundation and precedent for the synthetic and artificial languages which became

fashionable m Renaissance and later times (see 9.3)

An interesting detail concerning a lost An of Memory attributed to Roger Bacon is mentioned by Yates i I960, p 261

fn). and by Hajdu 11936, pp. 69-70). Yates says. "There n a rumour that Roger Bacon wrote an ars mtmorarna treatise,

but this has not so far been traced," Hajdu refers to a work by C. O Revendow (1843. p* 41 1, which, again, quotes a still

older work by Von Aretin (1806). which latter I have, un form na tel v. been unable to crack down. Reventlow s comments

may be summarized as follows: Bacon had written a T racks t us dr Aru Mtmoranva. to be found in a manuscript at Oxford .

this manuscript, never printed, has not so far been discovered. While Bacon was not known as a teacher of mnemonics, he

was reported by Aretin to have employed a method based on that of "the classical authors (presumably Gccro and

Quintilian J.

Weuacoct f 1953. p 92) provides another very tantalizing reference to

this lost mnemonic art of Roger Bacon, and j

magical method employed by him to teach the elements of Greek and Hebrew grammar Bacon claimed on several

occasions that he could teach the essentials of Greek and Hebrew to the first comer within three days, sufficient to permit the

student to read and understand foreign words in scriptural texts. Characteristically, Bacon backed up his claim with the

forthright and combative statement. "Dabo caput meum si deficiam" f T will forfeit mv head if I fail"). 1 have, alas, been

unable so far to discover the sourer to which Westacon refers: a work, supposedly in preparation in 1953 by Bcryt Smaller

and Evelyn Jaffe. to be published in the Medieval and Renaissance Studies of the Warburg Institute, which would explain

the magical art of language teaching employed by the Admirable Doctor.

Encyclopedic mnemonic systems such as those described above constituted, in effect, a sort of universal code or synthetic

language, associated with single letters and clusters of tenets from a mixture of alphabets, and used more or less arbitrarily to

54

represent a variety of subject categories This is che primary source of their relevance to our present task, the stud* ot the

Vovmch manuscript. Some such sysrem might well underlie the code-Uke structure of words demonstrated by Tiltman in the

Vovmch text. Many of the circular diagrams in the manuscript, with their rows of cells in concentric circles containing

pictures or labels or bits of text, are also reminiscent of the diagrams of LuJL CamiUo. Bruno, and others

8.2 The Hermetic Tradition

A set of philosophical and mystical doctrines of great conceptual richness and beaury. the Hermetic writings were or

primary importance during the late Middle Ages and rhe Renaissance. The besr single general treatment uf the topic is.

again, by Frances Yates f 1964). Another good clear overview, from a less sympathetic but still fair point of view, is that or

Shumaker (1972). The Hermetic writings, composed by various anonymous Hellenistic authors around A.D 100-300.

represented an eclectic amalgam of Platonism-. Stoic ism. Jewish and Persian philosophy, and a certain admixture of ancient

Egyptian religious elements The doctrines became known to the Middle Ages when a monk named Leonardo da Pi stein j

brought to Florence a Greek manuscript of what came to be called the Corpus Htrmettcum, It was translated at the urgent

command of Cosimo de' Medici during the years 1 462 — 63 bv Marsilio Fictno iwho was himself to become a future of

considerable prominence through his magten- medical system of astrological images and doctrines). The newly, translated

Corpus Hffmtttcum, published in 147 L was explosive in its popularity and influence, and founded an intellectual movement

which was to be of central importance in European thought.

The Htrmtnc a las the entire collection of Hermetic wrinngs is called 1 were attributed to Hermes Tmmcgisrus. a

legendary ancient Egyptian seer or god (identical with the Egyptian god of wisdom. Thoth). regarded as a recipient and

channel of Divine illumination, and a contemporary or predecessor of Moses. Festugiere (1944-541 provides what is

considered the most scholarly edition and commentary on the Hermencu: Scott (1924-361 gives an English translation,

although Yates apparently does not consider it accurate (1964. p. 22 fnl. The Hermetic Tradition provided a motivation and

frame of reference for astrology, magic, alchemy, and all the occult sciences which held a predominant influence in Western

thought for many centuries: this philosophy, as it was interpreted by Renaissance thinkers, probably set the stace tor modern

science and technology as well. The Hermetic doctrines frequently emphasized the almost limitless power of the human

mind, as partaking of the Divine Mind or Nous, It seems probable that the present albencom passing hybris of modem

science may be traced in pan to an origin in the Promethean doctrines of Hermeticism. regarding man as a potent creative

Demiurge, capable of standing beside God as co-regent of the natural universe John Dee. Cornelius Agnppa. Giordano

Bruno, Marsilio Ficino. Giovanni Pico Della Mirandola. Giovanni Battista Porta, Trithermui — these and many other

figures of late Medieval and Renaissance philosophy drew their inspiration from the springs of the Hermetic revelations

What was the nature of these philosophical and mystical doctrines, that gave them their power over the mind uf man

during some of the most creative centuries of Western history.' Modern scientifically-oriented writers like Shumaker i 1972 1

find it hard to understand their appeal. It is amusing to note that Shumaker, m his Preface, frankiv speaks of his shock and

bewilderment at the enthusiasm of his young students, who rush up to the podium to question him eagerly after a lecture on

Htrmetinsm In a highly interesting personal confession, he discusses his own adverse reaction to the Hermetic doctrines, his

difficulty in comprehending the " irrational' point of view on reality embodied in them, and his inability to reconcile them

with the positivistic attitudes of modern science with which he is so much more comfortable.

So that the reader unfamiliar with them may gain an idea of the impact and beauty of these writings. 1 will quote two

paragraphs of an excerpt translated by Yates (1964. pp. 23-24 L drawn from an account of the creation of the universe and

of man in the Ptnumdtr (one of the books of the Corpus Hermetrcum).

(The will of God first broughi forth i second creative power, or Nous-Demiuree. who in turn faihiuned rhr Seven Governur a i planets i to

83 Astrology and Astronomy

Such a vast and complex area of symbolism is covered by the medieval and Renaissance disciplines of astrology and

ascronomy that only the briefest possible summary can be presented in these paragraphs, I will concentrate here sink on a few

salient matters of possible relevance to the Voynich manuscript and in particular upon certain sets or

senes of names and

symbols that might conceivably underlie some of the sequences of text strings in cells of the astrological and cosmological

diagrams. Good general discussions of the subject may be found in Shumaker f 1972), Wedel (1920), Graubard 4 |953>,

Boll and Bczold (1931k Allen (1941). and Duhcm (191 3-1959), A detailed catalogue (with numerous illustrations! of

Latin astrological manuscripts of the Middle Ages may he found, in Saxl (1915 and 1927 k

The twelve months of the vear. the houses* of the zodiac signs* the association of these with Cabalistic names for the

celestial spheres and the 'Sephiroth, ' names of angeb and demons, etc*, all form sequences of twelve important elements

Another set of astrological symbols is that of the fifteen major fixed stars that enter into the zodiac constellations or are in the

path of the sun across the skv [see figure 29). The star names are of obviously Arabic origin l transmitted to the Middle Ages

by the Arab commentators on Greek works such as the Aimagist of Ptolemy). A twenty-eight element sequence which nuv

be of relevance to the Vovmch manuscript is that of the stations or "mansions" of the moon. Figure 30 shows some names

of these stations taken from two major sources.

An important series of thirty -six symbols is that of the "decam/ "prosopok or 'faces* 1 of the zodiac signs. These decans,

of which each sign has rhree. had their origin in ancient Egyptian sidereal gods of time, associated with the daily and nrghtly

route of the sun among certain constellations and stars. These beings were regarded as powerful demigods or demons who

ruled over the celestial spheres; they were often called the "horoscopes." Each exercised powers over a pan of the human

* n ^lyptun medicine, and each was associated with one of the "nomes" or geopolitical divisions of ancient Egypt,

Gufldel f 1936) and Seznec f 1953) provide a detailed summary of the history of the names, images, and attributes of these

thirty-six celestial beings, from Egyptian times through classical anciquiry into the Middle Ages via such works as Picatrtx .

and ultimately into the Renaissance and into modern astrology. Each decan. following Egyptian practice, was associated with

a vivid graphic image; these colorful symbols were often depicted in Renaissance mosaics and frescoes, and served frequently

as memory images to the nchly embellished artificial memories' of Renaissance magi such as Giordano Bruno Figure 31

shows some stages of the development of decan names from Egyptian through Coptic and later times. Father Petersen

collected and studied the Coptic decan names with a view to their possible relevance to the zodiac diagrams in the Vovmch

manuscript. Unfortunately, there seem to be no cases of thirry-six elements in these diagrams, or even in the cosmological

and astronomical diagrams (see figures II and 12), and the decan images bear little relation, either in their original

Egyptian or later Renaissance forms, to the nude female figures in the manuscript.

8,4 Magical Systems

I have not found any single work chat covers all of the systems in a scholarly manner, though separate treatments exist for

3 num ber of the major traditions Shumaker (1972) provides a good survey of Renaissance systems under the chapter

heading White Magic. Thorndike (1923-58) presents extremely detailed (if also rather brusque and unsympathetic)

individual summaries of the magical philosophies of many ancient and medieval writers. Walker (1958) provides good

coverage of some late medieval and Renaissance systems. Yates (1964) deals thoroughly with Giordano Bruno and some

other philosophers of magic. Ritter and Plessner (1962) cover the Picatrix magical writings with great completeness

Seligmann (1948) and Dc Givrv 11971) make available numerous illustrations of magic alphabets, diagrams, seals,

talismans, etc. Mathers 1 1974) covers the Solomoman and Mathers (1975) the Abrameiinian schools or traditions of ritual

magic. It is amusing to note chat many of these works have recently been reissued in paperback to satisfy the current

enthusiastic surge of public interest in the occult. The following paragraphs will include only a few major or salient magical

systems, with ar indication of their character and possible relevance to the Vovnich manuscript

-56

8.4 J Picairix.

A comprehensive compendium of astral and sympathetic magic. Picainx was influential from the fifteenth cenmry on in

European thought. Probably of Hellenistic and Arabic origin, it was translated from Arabic into Spanish at the order or

Alfonso the Wise, in 1256, but did not become available in a Larin version until the fifteenth century, it is a rich, eclectic

conglomeration of images, seals, characters, and incarnations based on astral and planetary demons and their powers The

name Pjcatrjx. according to Ritter and Plessner (1962), is a medieval garbling of an Arabic name Buigraus, which may in

turn be derived from the Greek "Hippocrates/" The work includes hvmns. pravers. and incantations to the planets and other

celestial bodies; charms for all manner of purposes (to chase a wav mice and flies, prevent a sweetheart from getting pregnant,

find loir objects. discover hidden treasure, cause people to quarrel or to make up, etc J. Many of tht

names, charms, anu

"characters' are referred to as "Indian"" or "Egyptian". in fact, hieratic or hieroglyphic symbols chat seem etaurly Eavpuan

are recognizable in some cases, as are Egyptian elements in spells shown in Roman letters i see figure 4U.

I have been unable 10 find, in a careful study of Ritter and Plessner's translation, anything that is directly similar to am

diagram or symbol in the Vovnich manuscript, with one interesting exception. The "astral ' or planetary" talismans in tht

form of geometric figures made up of line segments interspersed with circles or dots representing constellations are strong U

reminiscent of the odd geometrical figures adorned with faces on folio 67v2. As we will see below, similar figures were

common in alchemical works as well land may have had a common origin in astral magic 1

8.4*2 Solomonian Magical Tradition.

The Jewish historian Josephus, in the first century AD. mentioned a book of incantations for summoning spirits, ascribe:

to King Solomon. A book called the ""Testament of Solomon" refers to a magic ring given to Solomon b\ angels, whith

conferred upon him power over various demons (whose names and functions are listed 1 Medieval writers speak of magical

books of Solomon, and a CUvicula Salomonis and SigiUum Sahmorsts (Kev and Seal of Solomons are mentioned in a

pamphlet written m 1456. The version translated by Mathers U974) is said to dare from the fifteenth century The

Solomoman magical tradition was the best known of all medieval magical systems. S. L. MacGregor Mathers, the translater

of this and the Abrameltman writings as well f 19751 was an interesting figure in his own right: j practicing ceremonial

magician and head of the Rosicrucian Order of the Golden Dawn at the end of the nineteenth century. The Solomoman

system depended heavily on Jewish Cabalistic sources, it features Hebrew characters and other symbols that Inok much hkr

some of those in Ptcatnx. and arranged in similar circular "seals'* or magical diagrams Like mosr high ritual or whiter

magic, it involved purifications, a devout religious frame of reference seeking power and guidance from God and trom o*ki

angels, and elaborate ceremonials with incense, robes, a special room or 'oratory and special furnishings, etc. There seems

to be little in this apparatus that even suggests any diagram or symbol in the Vovnich manuscript.

£. 4-3 Abramtlinian Magical System.

The magical books of Abramelin were translated by Mathers f 1975) from a French manuscript in the Biblioiheout dt

T Arsenal dating from the seventeenth or eighteenth cemurv. This, in turn, claims to have been

translated from an original

Hebrew manuscript dated 1458, One Abraham the Jew, born 1362. is supposed to have obtained the mapt lore from an

Egyptian magician named Abra-melin. the magical system presented is said to be based on, but not identical with, the

Cabala, Abraham wrote the description of this philosophy for his vounger son. having presented his cider son with j

compendium of the loftier and more highly-regarded Cabalistic tradition. The Abrameliman system is similar m its

ceremonials, purifications, incenses, draperies, etc., as well as in its general character, to the system of Solomon discussed

briefly above The seals and charms, however, are considerably more verbal and abstract, and more explicitly Cabalistic in

appearance; instead of circles and pentades. they consist entirely in "magic squares' containing Roman letters representing

Hebrew -sounding words. Long lists of demons and their functions are provided, along with detailed instructions tor usinc

and working with these demonic powers.

The pragmatism of some of the advice is remarkable, even startling to the unsuspecting modern reader coming upon these

writings for the first time, I cannot resist quoting some examples; "It is not necessary w observe am ceremonies in order to

send a way rhe Spirits, because they themselves are only too glad to be far a way from you. (Mathers 197 5, p 9 " -

"Communicate unto them fthe evil spirits) also the Form in the which you wish them to appear. .You ought the evemne

before to have demanded this from vour Guardian Angel, who knoweeh better than vou vour nature and constitution, me

who understandeth the forms which can terrify vou. and those of which vou can support the sight ip. 90 1 Let me here

once again inmr on The absolute necessity in occult worktni of being courteous, eten to the Evil Sptrtts, tor the Operator *ho

is insolent and overbearing will speed* l v iai himselt open to obsession by a Spirit ot like nature, the which will brine about

his ultimate down fall/' I p. 102)

Four familiar spirits were assigned to each operator in constantly rotating six* hour shifts, he could lend them to others,

and is advised to keep them busy and out of mischief. He can, however, also give them time off when he has nothin* tor

them co do. "The familiar spirits are very prompt, and they art able to execute in most minute detail all matters of j

mechanical nature, with the which therefore it is well to occupy (hem: as historical painting: in making statues: docks,

weapons; , . /* ip, 362h There is an irresistible realism and psychological sophistication about all of this, which almost

forces upon the reader the belief that the magical operator was interacting with an actual force of some kind, it least

within his own mind. In fact, the accepted modern theory of magic, on which present-da c magicians base their thrninc

operations, locates the powers being capped by the magician in the depths of his own subconscious

In spite of the great intrinsic interest possessed by this magical tradition, it too seems, unfortunately, to be mmmwlh

related to the drawings and general character of the Vovruch manuscript.

8 - 4-4 John Dee's System of Spiritual Magic *

John Det. wi h his server Edmund Kellev. developed an elaborate magical apparatus involving con vexation of, and

comm unit i Don with, angels or good spirits. Since, as we have seen, some students feel that Dee may have had some

connection with the origin of the manuscript, hu magical philosophy should be of particular relevance to our usk Det

regarded his magic as a devout religious undertaking that would bring him into closer con tan with God: Keltev was j much

more equivocal personality, mentally unstable, of a violent and avaricious temperament, and avidly ready to employ jnv

means to get wealth and power. His mam interest seems to have been in alchemy, and tn a life-long endeavor to penetrate to

the secret of making

gold. To whit extent Kellev victimized and deceived Dee cannot be guessed, but it may have been considerable, since all of the "angelic "messages were recaved by and transmitted by Kellev. Dee himself had, as he

confessed, no ability whatever to see the visions in his crystal or hear the angel voices, and was apparently entirely dependent

on Kellev On the other hand, some writers have suggested that Dee was subtle exploiting Kellev for his own purposes, and

tolerated his treachery and his ill-natured outbursts for this reason h is hard to imagine, in any case, how either of the two

men could have invented so elaborate and remarkable a system wirhour the knowing cooperation of the other

Dee s angel names arc reminiscent of Cabala, and have a strong Hebrew flavor: his magical system as a whole, however, n

said by Deacon f 1968) to be quite distinct from any other well-known Cabalistic or Hermetic tradition. It included a

synthetic language of great complexity, in which Urge volumes of text were communicated to Dee and Kellev by various

angels, and which employed an invented alphabet: this language and alphabet may be of relevance to research on tht

Vovnich manuscript. They will be described, along with the practices and circumstances accompanying their revelation to

Dee and Kelley, in Section 9.4 below Dee s connection with the Rosicrueian movement, his philosophy

in general, and the

nature of the "hieroglyphic" manuscript in his possession will be discussed in Seen on 8.9, For more information regarding

Dee i angelic magic, see Casaubon (1659), Deacon fl968L Dee f 1963, 1968 j, Fell- Smith (1904), French i $19 \sim 2i$ and) os ten (1965).

8.5 The Galenic Medical T radition

Galen, according to Thorndike (1923—58), wrote a voluminous medical encyclopedia f twenty books of about 1000 pages

each) about A,D, 129 These works are not well known to modern readers, and are described by Thorndike as relative) v

inaccessible ", The humoral system of medicine, ascribed originally to Hippocrates, was elaborated by Galen and by medieval

Arabic commentators such as Haly ben Rod wan, R hazes. Haly Abbas, and Avicenna The tradition was predominant in

Europe over a long period of time, and survived in some form up until quite recently: it continues to thrive, in more or less

concealed forms, in much modern "folk" medicine. Good general treatments of early medical history may be found in Singer

and Underwood (1 962). Singer (1928, 1959L and Taylor fl 9221.

In the Galenic system, food was processed by the human body through four stages or disgesiioos", each of which

produced a nourishing product to be passed on to the next stage, and a waste product to be excreted. The "humors — blood,

vellow (or ruddy I bile, black bile, and phlegm — were the excreta of certain stages of digestion. The words 'melancholic.

choleric," phlegmatic/' and sanguine which soil survive in our language to describe temperament or personality, arc

survivals of the names of the four humors. Each of the humors had certain "natural qualities", which gave it its influence on

58

the human body. temperament, and mind These were combinations of cold, warm, wet. and dry. Depending upon the

balance among the four humors in the constitution of a particular individual, he was said to have a particular "complexion

Disease arose, according to the Galcmc theory, from a serious imbalance among the humors and their natural qualities

Similarly changes in this balance accounted for the different cons rinse to ns of vouch, maturin', and old age The balance

differed also with the seasons, and in the constitutions of the sexes; different foods, herbs, and other

substances had

important effects on the balance of the humors and their qualities, and were considered to have characteristic qualities oi

their own. The celestial bodies each had a crucial influence on the organs of the human body, the digestions, and all the

other dements of the theory. The "microcosm" or "small world" of the human body was held to reflea in miniature alt the

relations and influences at work within the macrocosm" or universe as a whole

The medical treatments employed by the Galenic physiaan took careful cognizance of the positions of the heavenly

bodies, and certain "critical days" were singled out, on which certain treatments could not safely be applied Cathartit

t purgative 1 expedients acting upon particular humors were an important part of therapy For example, the herbs sage and

betony were supposed to draw and purge phlegm and water; rhubarb acted on choler < yellow bile!; and senna purged

melancholy (black bile). Blood was purged by the obvious method of opening a vein and bleeding the patient

("phlebotomy"), Thus, the Galenic physician was a skilled practitioner of "cathartic and phlebotomy

Heat and moisture were highly important in the Galenic therapies. Heat was the principle of lift. greatest at birth and

early vouch, it was thought to become gradually exhausted and cooled with advancing age. Old age involved an excess ot

coldness and drvness, so that warm baths and applications of warm oils and unguents were recommended fur the elder U

Another sovereign remedy for the bad effects of old age was the contact or embrace of a young person or animal, enabling

the aged person to regain some of his lost hear and moisture by contagion from the superabundance m the younger creature

The roval road to health could lead, thus, to a warm puppy, or better soil, a youthful maiden. Astrological and astronomical

lore were obviously also of great importance in Galenic therapy; the physiaan almost had to be a practicing astrologer us

well. The "medical month" consisted of rwenty -eight dan fa number which recurs in the diagrams of the Vovmch

manuscript), and the influence of the moon was of considerable importance through its effect on moisture and the tides.

Roger Bacon, in his medicinal work (Bacon 1928a). provides an extremely complete, dear, and detailed explanation of

astrology as it related to medicine (and WichingTon, in hts preface to rhe work, gives an excellent general summary of

Galenic doctrines and Bacon's contributions and sources as well). Figure M shows some saltern features of Galenic medicine

m "fours"; some of the terms may well underlie the labels and text strings in certain cosmological and astronomical draw ings

in the manuscript, and possibly to the zodiac diagrams also. They may be involved in the "human

figure drawings as well;

the omnipresenr puffs of vapor or foam could well represent the humor or qualities, the digestions, etc. Terms referring to

degrees of coldness, warmth, wetness, and drvness may even be concealed in the text of herbal folios, as fhev are frequently

mentioned in anaent and medieval her bah as properties of medicinal plants.

8,6 Ars Notoria; Demonic and Angelic Magic

I have found relatively little material directly concerning this topic, although it is mentioned to passing in many of the

works cued in Section 8 1 above. Yates (1966) describes it as a magical art of memory, using 'shorthand notae or symbols,

and regarded as a very black kind of magic. Walker H958) discusses certain systems of "spiritual magic in considerable

derail Thorndike (1923-58) characterizes An Notoria as an an designed to gam knowledge of and to communicate with

God by the invocation of angels, using mystical characters and prayers; he also dismisses all the material as "meaningless

jumbles of diagrams and magic words" without telling us much more about it. The essence of the Ars Notoria seems to have

been the use of angels 1 and demons names, and an attempt to exploit these intermediaries as channels of illumination and

power from God Tnthemius (S\$eg*nographia w 1606). the Solomoman and Abramelmian magical systems, and

John Dee s magical practices all made hetvy use of invocations directed to demons and spina. Figure 33 shows some lists of

names from various systems, and figure 32 provides some examples of the seals, talismans, and diagrams employed to invoke

and control these beings. The spirits were intricately connected with the four directions, the elements, the celestial spheres

and other cosmological entities, and so may have been named on some of the Vovmch manuscript folios

8,7 Cabala

The nmutal Jewish philosophy known as Cabala lor Kabbalah l developed in Spain during the Middle Ages. A thirteenth-

cemurv book called the Zohar. originating in Spam, was an important source of Cabalistic lore for later writers The Cabala

59

depended heavily on manipulation of the letters of the Hebrew alphabet and lists of sacred words, and was in central hiefah

verbal' and abstraa in character, in contrast to the iconic, visual qualm of mam other magical systems. The names of Gi»d

and of angels and the Hebrew letter s were employed in wavs strong! v suggesting to us. today. cryptologic techniques > and. m

fact, the manipulations of the Cabala mas have inspired at least some early cryptographic devices*. "Magic squares" were ,i

prominent feature of the system, Ten basic elements called the 'Sephiroth' were essential to the doctrine, these were

supposed to represent the powers or attributes of God. and were associated with other entities < ten spheres of rhe universe.

etc.J in a typical medteval table of correspondences (see figure 35 1 The Hebrew letters were all associated with unique

numerical values and a Cabalistic method called M femama" permitted alternative words havtne the same numerical values ft*

be substituted for sen uf names such as the Sephirorh Another Cabalistic art called temurah ' involved anacramminc

sacred words.

Most of the major magical systems of later times made at least some use of Cabala. Hebrew lure and the Hebrew Ungu jcc

and alphabet were regarded,

because of their Biblical association, as especially holv* ancient, and magically potent >X'hile the imagery and "feel" of the Vovnidi manuscript does not seem very close! v akin to the dry. abstract and ascetic

atmosphere of Cabala, the importance of the doctrine and of the Hebrew words originating in it to medieval magic in genera]

make it worthwhile for a student of the manuscript to be at least superficially familiar with it. We have seen above (5. 1 i that

New bold attempted to use a Cabalistic principle involving all combinations of the letters of the Hebrew alphabet taken two at

a time as a pan of hts decipherment method. This, in itself, seems to have been an tmrenmus and rather reuvnfiilblt

hypothesis, however mistaken it has turned nut to have been General coverage of Cabala rtuv be found in Blau * hM-t ,

Mathers f 195 U, and ^JTaiie i 1929i.

8,8 Alchemy

The topic of alchemy has been dealt with by many writers in mans different ways. Shumaker t 19^2j and Graubard

M 95 3 1 present good general treatments, and Thorndike i 1925-58* discusses alchemy in passing as he describes the writings

of various ancient and medieval practitioners. Singer 11928-311 provides a comprehensive catalogue of alchemical

manuscripts, and an equally comprehensive listing of alchemical terms and symbols may be found in Gessman U922i

Ashmoic 0652* presents a large and valuable collection of old manuscripts, permitting the reader to gain an excellent

feeling for the nature and scyle of their texts and illustrauom.

The origin of alchemy apparently cannot be traced back to any one source with am certainn It was artnbured to the

Egyptians. Babylonians. Jews, and perhaps even to the Hindus and Chinese. Medieval writers ascribed its origin to Hermes

Trismcgmus. and much of the alchemical lore that came down to the Middle Ages probably had its source among the

Alexandrian Greeks in rhe eariv Christian era. ft was transmitted to Europe from the Arab world through a translation m

1 144 of a work entitled 'B<iok of the Composition of Alchemv Interest in alchemv was long-lived, continuing into the

seventeenth century when it began to decline: the eighteenth century is regarded as the end of its real influence Elias

Ashmole IA.D 1617-1693. founder in 1683 of the Ashmolean Museum in Oxford, the first public museum in the

British Isles), was perhaps the last prominent enthusiast for alchemy.

The doctrines of alchemy covered a very broad range of technical practices and natural phenomena; it is difficult indeed to

disentangle its intimate intermingling of Galenic medicine, philosophical and religious mysticism (Christian and pagan*,

mythology, astrology, botany, /oology, miner a log v and primitive chemistry. It was an all -embracing magical or religious

philosophy as well as a more or less operational set of techniques. There were two main forms of alchemy; practical alchemy

was the actual attempt to create new compounds or substances by chemical operations, and prominently, of course, the

attempt to produce or multiply gold. It arose, in all probability, from early metal-working and smelting lore passed down

through the ages from eariv man in the Near East. Theoretical alchemy. on the other hand, was a philosophical doctrine

about the nature of the universe and of matter: an eclectic amalgam of Gnosticism, Neo- Platonism. Christian mistical

doctrines, and pagan mythology There was no hard-and-fast line drawn between these two branches of the arc. typically.

each practitioner of alchemy struck his own preferred balance between the smoke, smells, and gadgetry of the laboratory and

the quiet of the study or the oratory of the magus.

It was customary for an adept m alchemy, especially one who claimed to have attained some practical success, to adopt a

son" or heir to whom he would pass on his wisdom at his death. Elias Ashmole was "adopted in this wtv bv an older

alchemist named WjlJiam Backhouse: Ashmole himself apparently never attempted the laboratory operations of practical

alchemy bur contented himself with reading and collecting manuscripts and studying the symbols and concepts of theoretical

aic hem v Almost all alchemical writings were routinely couched in a highly mysterious, deliberately misleading and

metaphorical language, codes and ciphers were commonly employed in the manuscripts, and extreme secrecy was the rule

60

In essence, us tar as modern writers Have been able to guess from the convoluted secret writings that have comedown to

u sj alchemy was based on a rheorv involving a fundamental constituent of all nature called the first matter or hyle

individual objects gained their characteristic identities that made them what they were instead of something else* through

the addition of qualities such as the cold* moisture, dryness and heat of Galenic medicine. In order w transmute an object

into another object, one must remove the "qualities' of one nature, get back to the neutral first matter. then add or cast

on" the qualities" of the desired nature (usually those of gold). This process involved elaborate sequences of manipulations

m the alchemist s' laboratory' that might occupy months or vears. cmplov the services of many helpers, and consume

incredible amounts of money and effort. Practical alchemy was a feasible hobby for only the richest of men.

The laboratory operations included a lone list of activities which are variously rand, needless to say, mystenuush defined

m the many alchemical treatises. They are described by terms such as calcination* solution, putrer action, congelation

fermentation, exaltation, and projection. The products ©! these processes And their appearance and behavior in the laboratory

glassware" or vessels were described in wildb metaphorical wavs (a biack residue was ' the raven' or the crow s head

a

corrosive acid was "the green lion'. ocher substances were called the snowv swan ", the toad that cats his fill, the

dragon', etc.). Substances were referred to as "medicine, '"menstrual fluid.' "blood." etc., or labelled with the names of

parts of the human body. Metaphors were taken from human social life T marriage' or wedding." 'copulation. death

and "burial"), and religion ("the passion of Christ, " "resurrection. purification. redemption"! In tact, almost any

name a anv natural or artificial object or process could appear as a cover -word" for some alchemical process or product

Et is mv own opinion that the Voinich manuscript could well be. at least in part, an alchemical treatise 1 feel that thi*

hypothesis explains the secrecy and mysienousness of its form, the difficulty of deciphering u or recognizing its draw ings in

am' conventional herbal or astrological illustrations of the times, and rhe apparent encyclopedic character of its concern. In

fact, the only two drawings 1 have found that have any dose kinship in style or treatment to those in the manuscript are two

illustrations in Ashmoie s Theatmm Chemicum Brttannicum i 1652). These are: a drawing of a plane, lunanu . on p 3-lb.

and a ivmbolic represent a non of an alchemical operation on p 350 Both of these are in a group of manuscripts of Ash mole *

collection which are identified, alas, only as 'anonymi The text, in paired lines of Old English verse, discusses herbs.

Christian mystical platitudes, astrological matters, etc. in the usual wildly heterogeneous conglomeration. It is apparently

much farther toward the "theoretical" or philosophical end of the spectrum than the practical.

The plant figure has many of the odd sivlistic features of the Voynich manuscript 5 herbal folios: the ngidh symmetric.il

arrangements of leaves and flowers; the "molded plastic", block v. or sculpturesque forms: the platform wirh abrupt edited

having a "cut out" look on which the plant is sifting, very similar in style to some root forms on the Voynich manuscript plant folios.

The other figure has elements resembling some of those in the folios showing nude human figures in tubs at liquid, A

doud-like form at the top. from which conventionalized ra vs emanate, represents God. immediately below, the figure ut .i

man or angel breathes into rhe mouth of a bulbous alchemical vessel, his breath is clearly indicated in exactly the *av that

the vapors or liquids are shown passing through the elaborate "plumbing on the Vovmeh manuscript folios. On the vessei

are a sun [with a face) above and within a crescent moon: from each of these, vapors or emanations are shown descending

through the vessel. The round botiom of the vessel is provided with seven spouts, spaced around its curved circumference

and the vapor emerges from all ot these and trickles down over two nude, plump human figures locking arms and hold me

hands; these figures, while bener drawn than the Vovmeh manuscript nudes, are short-legged and "hippv'\ w t ch tar

tummies, in a verv similar style. Two dragons standing on their heads and a toad complete the composition The style of the

seven spouts on the vessel is so close to that of similar spouts and vents on the pipe-iike forms in the manuscript as to be

aimost indistinguishable, and the symbolic use of conventionalized forms to create a new synthetic whole with a complex

meaning also seems closely akin to the methods of the Vovmeh manuscript's scribe or scribes While chest drawings art

identified only as anonymous in Ashmole's collection, 1 have discovered some highly similar figures in ocher works where

they are associated with the writings of George Ripley, a fifteenth -cent urv alchemist who produced numerous treatises with a

strong Christian flavor (Philalethes 1678, Rrplev 159L E756L De Rola (1973. figure 64 1 shows a

figure similar to the

second described above, citing us source as De Errorrbuj* by John Dastin f British Museum. Eg ere or 845 folio Pvi

In any case, k seems likely that a thorough examination of alchemical manuscripts and their illustrations might amply

repay the efforts of am - student who could gam access to them.

83 The Rosicruda n Movement and John Dee

While Dr John Dec has already been mentioned quite frequently in this monograph, it remains to provide a fuller

discussion of his thought, his writings, and his connection with the Rosicrucian movement, a philosophical tradition whirh

61

mav. itself, have some bearing on the Vovmch manuscript There are a number of good treatments of John Dee s life and

thought, nocably Deacon (1968). Fell-Smith (1904). and French (1972). Yates (1972) covers the early Rosier urian

movement very thoroughly, and deals with Dee in that context. Dee s private diary (Dee 1842) and a hit of the manuscripts

m his large collection \ James 1921) are of considerable (though leu general) interest.

The Rou crucian movement, centering m the Palatinate region of Germany but having wide-ranging repercussions in

other European countries, was essentially an attempt to liberalize religious and philosophical thinking: it combined the rich

heritage of the Hermetic tradition with Christian mysticism and a generous admixture of alehcmv. Cabala, magic, and

medicine The Rosicrucians were fanatically secretive. The authors of the original Ron crucian 'manifestoes" (the Fama and

the Confeino, both reproduced in translation in Yates 1972) never revealed their identities. They claimed to have founded j

' brotherhood/' and appeared to invite new adherents; all attempts on the part of would-be recruits to get in touch with the

founders seem to have been fruitless and certainly received no open response (although there may have been some well*

concealed contacts and acn vines behind the icenesh

The Rosknidan doctrines, like those of alchemy to which they are dosciv akin, manifested a highly devious and

convoluted use of symbols and imagery. To the amalgam of devices familiar tn alchemy, the Rosicrucians added political

symbolism related to the prominent conflict between Protestant nations and leaders, organized around Frederick V (Elector

Palatine of the Rhine, and married to Princess Elizabeth, daughter of James 1 of England) and the reactionary Catholic

house of Habsburg These quasi -political symbols with religious and mystical overtones included the Habsburg eagle, the

Palatine lion, the red rose, images related to the Order of the Garter/' and symboh taken from or akin to those m John

Dee s writings, especially his Monas Hieroglyphic* (Dee 1564. 1964 L

John Dee. according to Yates, 'belonged emphatically to the Renaissance Hermetic tradition, brought up to date with

new developments, and which he further expanded in original and important directions' (1972. p. xnJ. Later, on the same

page, she describes Dee s contributions as follows: 'In the lower elemental world he studied number as technology and

applied sciences. . . . in the celesnal world, his study of number was related to astrology and alchemy, and in his Monas

Hiero%lyphica he believed he had discovered a formula for a combined cabahsi. alchemical and mathematical science which

would enable its possessor to move up and down rhe scale of being from the lowest to the highest spheres. And in the

supercelestial sphere Dee believed that he had found the secret of conjuring angels by numerical computations in the cabalist tradition /'

Dee s influence was earned to the European continent, where he made extensive visits from 1 58 3 on. He was. according

to Yates, very active to surring up new movements in Central Europe, though his work there has been studied less thoroughly

than his life in England. It would seem that Dee was somewhat of an intellectual leader in Bohemia, not only m alchemy,

bui in a religious reform movement, the nature of which has not yet been investigated and explained fully. Most of the events

discussed in Yates treatment of Dee and the Rosicrucians probably look place after the Voynich manuscript was already in

existence. It seems to me very likely, however, that there is some kinship between the philosophy underlying the manuscript

and the Rosicrucian tradition. Because of the known association of the manuscript with Rudolph's court and possibly also

with Dee. and the obvious similarity of its secretive, synthetic symbolism to that of the Rosier uciarn. a serious studem can

scarcely afford to ignore any of this highly in t ere sti ng material.

A brief word should be said concerning the "hieroglyphic manuscript' which Dee was reputed to have had to his

possession, and which some wrters have identified with the Voynich manuscript. The letter written in 1675 by Sir Thomas

Browne to Elias Ash mole, and reporting the words of Arthur Dee. John Dee's son. concerning this mysterious manuscript, is

quoted by Fell-Smith (1904) as follows: "The transmutation [to gold) was made by a powder they had.

which was

found in some old place, and a book lying by it containing nothing but hieroglyphicb; which book his [Arthur sj father

bestowed much time upon, but I could not hear that he could make it out.' (p. 311). Arthur Dee. born 1579. was

apparent! v eight years old it the time he saw the events he describes.

Another history related by Fell-Smith probably records the origin of the manuscr ipt and the powder "ICeUev is reputed to

have been wandering in Wales. . . when he stumbled upon an old alchemical manuscript and two caskets or phials containing

a mysterious red and white powder/' (p. 77). It was Kelley, in any case, who brought the powder and the manuscript to Dee

when they first became acquainted. In fact, one gams the definite impression chat Kellev's original purpose m seeking Dee

our (under an assumed name at first) was to gain his assistance, and probably his monetary backing, for an attempt to puzzle

out the meaning of the manuscript and to use the powders to make gold

Dec s diary, as edited by Halliwell (Dee 1842) provides no further information concerning the manuscript or the powder

] os ten. however, in a highly interesting recent article U965J. describes a portion of the diary that had been discovered m a

source separate from the remainder; this excerpt does, indeed, contain considerable information on the matter It records in

62

great detail an incident during the time when Dee and Kelley were engaged in communication with the angels. the spirits

instructed them, through Kellev, to destroy all their precious books and occulta, including the hieroglyphic manuscript and

the powder. This sacrificial act, intended to be a test of their high purity of purpose and submission to God * will, required

their placing the objects into a furnace (undoubtedly a pan of the furnishings of their alchemical laboratory! and permitnnc

them to be consumed by the fire.

This ceremony or bit of sleight of hand (for it was apparently an elaborate deception, either worked on Dee by Kellev for

some purpose known only to his unbalanced and unscrupulous mind, or else perpetrated by both men for some unknow n

common purpose upon a third party) was duly accomplished: the next day. all the "destroyed arcana miraculously

reappeared, to be rediscovered whole and undamaged by Kellev in the ashes of the furnace. The description of the

ceremonial burning includes a tantalizing glimpse of the hieroglyphic manuscript itself, which is

described as being small bui

written m letters "larger*' than those of usual writing, and to have been stored in a velvet bag or sack.

On his break with Dec in .Prague. Kellev kept most of the magic powder; what ultimately became ot the manuscript is not

reported in any of the sources 1 have consulted. It seems likely that Kelley kept that also (since it had apparent! v been his

from the beginning) and subsequently sold or relinquished it to Rudolph. Unfortunately, the mere characterization of this

book as being "in hieroglyphics" is not enough to warrant a secure identification with the Voynich manuscript, since many.

if not most, alchemical treatises were couched in secret characters. It was more usual, however, for the secret symbols to be

mterm xcd with Latin or some other more familiar letters after the fashion of a rebus. It also seems likely that Dee would

have been familiar with ihe alchemical symbols, and would have had no trouble in making some sense out of them, however

little success he may ha ^attained in making gold according to their instructions. Section 9.4 provides a somewhat fuller

discussion of alchemical symbols, and figure 42 shows some examples.

8.10 The History of the Hindu* Arabic Numerals

In view of the strong possibility that some, at least, of the Vovnich symbols may be early forms of numerals, something

should be said about the origin and development of these numerals in Europe. Figure 16 shows a sample of some carly

numeral forms that bear a resemblance to some Vovnich script characters. Two good general studies of the origin of Arabic

numerals are Hill (1915) and Smith and Karptnski (1911). The original birthplace of the numerals is veiled m uncertainty

they could have come from Egvpt, Persia, China, or Mesopotamia. Their history can. however, be ciearly traced in India and

then in their very gradual adoption in Europe. The Hindu system of numerals, including place value and a symbol for

"zero", was transmitted to the Arabs at a relatively early date. Smith and Karpmski trace the first introduction of the Hindu

numerals to a visit A.D. 77 £ by a Hindu astrologer to the court of the Caliph, where his astronomical tables were translated

into Arabic. Ocher Arab math en> a no a ns (among them Al-Khowarazmi, who gave his name, in the form algorism or

algorithmi/' to arithmetical calculation using the new numerals,

and ultimately to our modern algorithm > based their

tables and computations on that translated work.

Arab writers continued to use the new numbers, consistently referring to them, and the arithmetic based on them, as

"Indian" well into the thirteenth century. The adoption of the numerals into Europe is hard to pin down exactly; Smith and

Karpmski attribute it to the travels of merchants and traders in Spain, where Arab influence was strong, as early as the ninth

or tenth century. Numerous visits to the Near and Far East were made by traders and missionaries throughout the Middle

Ages: the travels of the Brothers Poli were unusual only in the thoroughness of their documentation and the interest they

have aroused in modern times. These travelers brought back many bits and pieces of foreign lore, some of it remarkable in

the wealth of its detail and vividness of description. The Hindu* Arabic numerals undoubtedly became known at least to some

through these accounts. One form of the numerals, employed in conjunction with the abacus, became known to Europeans

under the names "characters" or "apices," and involved unusually bizarre and ornate varieties of the symbols.

The adoption of the new numbers in Europe was an extremely slow matter. They seem to have been known or mentioned

by some writers for a considerable time before they came into anything like general use. They were not employed by

merchants for the practical calculations of commerce until surprisingly late. Leonardo Fibonacci of Pisa, bom about 1175.

did much to introduce the numerals to Europeans. His Liber Abaci, written in 1202 and rewritten in 1228. explained the

new numbers and used them as they would be employed in the usual computations of business. The methods he presented

were rejected both by the conservative mercantile class and by university circles, according to Smith and Karpmski ip, 131).

The bankers of Florence were forbidden to use the new numerals in 1299, and "the statutes of the University of Padua

required stationers to keep the price lists of books non per Ctfm, sed per iiteras Claras'", Ip. 133),

63

Still the new system made some headway from 1275 on. It is interesting to note that the common folk of Northern

European nations Like Germany rarely used Arabic numerals before the sixteenth century. The invention of cheap paper, lead

pencils, and modern methods of multiplication and division did not come about until quite recently: these were the

developments that, according to Smith and Karpmski, really made the new 'algorism'" attractive and practical for everyday

use. Before that time, the Arabic numerals were employed primarily on coins, for numbering the pages of manuscripts, and

for dates, They are often found intermingled in bizarre wavs with Roman numerals: e.g,. "'IVGjj" for 1502 ":

"NFCCCC^O" for T45G': and 'M.CCCCSii ' for "1482". In the early and transitional phases tif their adoption, the

numerals or "ciphers * were regarded as incomprehensible, mysterious, strange, and well-suited for use as cryptic symbols in secret writing systems.

8.11 Medieval and Renaissance Costume

The clothing of some of the human figures on the pages of the Vovnich manuscript should afford us some due as to eht

dare and provenience of the work. Unfortunately, the drawing is so sketchy, and the figures are so small and lacking m

detail that there is disappointingly little to go on. A wide vanery of hats and headgear are in evidence, even on figures

otherwise entirely nude, these include a variety of diadems, tiaras and crowns as well as wide-brimmed hats, floppy tam-u-

shanters, and hats provided with ribbons, veils, or plumes falling over the wearer's -Shoulder or back. Dress of women and

perhaps also men includes a sort of long pleated robe with wide sleeves (see Virgo and one of the Gemini twins, figure 10

Verv common ts a kind of knee-length. pleated tunic belied at the warn isee Sagittarius, figure 10) Costumes of this type

were common during the fourteenth, fifteenth, and sixteenth centuries throughout Europe, There seem to be no examples of

more extreme styles; the tall conical hats or rwo-horned headgear for women: the exaggeratedly puffed pantaloons and huift

ruffled collars for men in style after about 1550: or the curly-coed shoes, very short tunics over skintight pants with

codpieces that were the height of fashion somewhat earlier. The garments shown, however sketchiiv. on the Vovnich

manuscript folios seem quite simple and restrained on the whole, and provide relatively little decisive information They seem

to me, from an admittedly superficial study, to be consistent with a date between 1 450 and 1550 (see Von Boehn 1*>64 for a

well -illustrated treatment of sixteenth-century costume). Some typical hat and dress forms from the Vovnich manuscript are

shown m figures 10 and J7,

64

text, nucr Ungual communication, and an encyclopedic mnemonic representation of human knowledge. As has been the Last

throughout these chapters on collateral research, 1 can present here only the barest suggestion of the material available to the

interested reader

9.1 Brachygraphy: The History of Shorthand

The ancient Greeks employed a system of abbreviations called Tironian Hand or Notation, ascribed to Xlarcus Tulhu'

Tiro in the first century before Christ i see Rose 1874* Allen 1889, Boge 1973*. New bold attempted to use each Greek

abbreviations in his decipherment method, as we saw in Chapter 5. Many later systems of abbreviations in Roman anc

medieval times were inspired by. or based on. this early Greek system, Figure 38 show's an interesting example of a medieval

shorthand system derived from the Greek methods: its strokes are made up of pans of the letters a through V and earh

forms of the Hindu -Arabic numerals This mtem. caJled "Notana Aristoteiis by its author, an English monk of the

thirteenth century* is of interest because of the resemblance of some of its symbols to the Vovruch characters (probably, in

mv opinion, due to the derivation of both from early numeral forms i. These symbols acted as bases* to which dots, lines, ere.,

were added to form words, Roger Bacon was reported by johnen l L940. p. 34 i to have been familiar with the Tironian

Notation, which he called *'ars no tat on a \

Cappeih 11949) presides a summary of the history of Latin abbreviation systems and cherr development from classical

mto medieval times, The Roman system made use of several devices single letters could stand for entire words or syllublt>

words could also be truncated or contracted* usually being provided with a mark or symbol showing that something had been

omitted i a tail or curlicue extending upward or downward* a line or curve above certain letters, a slam line, etc . * Figure 1 "

shows some Latin abbreviations used in the Middle Ages that resemble characters of the Vovnich script Among central

works dealing with the histon of shorthand and covering the earliest systems are Gmlieni ' 1%8i and Johnen < 1 L Mii

Alston t 1 966 j provides a bibliography of works on the subject.

Most early European or English shorthand systems I have examined are designed around simple lines and curves, to which

dots, dashes, circles, hooks* etc., are attached ar various positions to form compound symbols standing tor whole words Must

ot these early systems were not phonetic. " i.e,* they made linie or no attempt ro show the sound of words independently of

spelling conventions as modern systems do In fact, the early systems tended more toward an

ideographic or symbol a

representation of ideas, although alphabetic elements were also involved. All of the systems were extremely elaborate,

requiring the memorization of vast arrays of arbitrary symbols that were difficult to write accurately and quickly, the modern

reader can only wonder how anvone ever managed to learn or remember their large numbers of rules and forms, or to record

the tinv docs and hooks with sufficient precision to permit distinguishing them later in attempting to read back w hat they had

written These methods certainly seem to have required far more effort chan ordinary wrtnng.

Duthie f 1970) provides an interesting comparison of three major systems in existence dunne Eliza berhan rimes. At least

one of them may have been employed ro record some of the texts of Shakespeare's plays during actual performances, so thei

must have been usable to some extent.] will summarize below, in highly abbreviated form. Duthie s presentation* the three

systems seem typical of the methods available in the sixteenth and early seventeenth centuries Thar authors intended them,

apparently, not simply for Transcription of speech as modern systems are employed. but also for rapid and condensed writing,

as a concealment method* and as a sort of elegant, philosophical mode of representing ideas'.

9 */*/ Characterie (Thomas Bright* circa 1 5S8)*

Figure 38 shows the basic strokes and the subsidiary elements to be added to each in Bright's system Each of the eighteen

base symbols consisted of a vertical line with a distinguishing hook, curlicue* etc., on its top; these symbols could be written

65

in four different positions I vertical, horizontal, slanted left, slanted right). In addition, to the loot ot each base symbtil imt oi

twelve additional squiggles could be added, making 864 combined symbols tor use to represent common words; these were

called "characteral! words' 1 Other words not in this

basic list were expressed by 'associating them as tvncmvms or

antonyms to a "cbaracrerall word 11 . and prefixing to it the first- letter base symbol of the actual word, to serve as a sort of

determinant (see the examples in figure 58 1. As Duthte remarks, this ivstem was primitive and cumbersome, placing a great

burden on the memory of its user, and producing forms which were very easy to garble and confuse

9*1.2 Brachy graphic (Peter Bales* circa 1590).

Bales ivstem employed ordinary Roman letters in combination with dots, commas, and accent s i

collective ji called h*

Bales eictles 'L which had to be very carefully and accurately placed around the letters to avoid contusion T hr

combinations of letters and "utiles* 4 produced symbols for a basic list of common words as in Bright's sysrem, and similarly

synonyms and antonyms were shown by using the base-word symbol with an extra stroke on the right or left. This shorthand

method required the memorizing of over 500 different srmboh; great precision in the placement of the tittles was

mandator v in order to avoid garbles. It does not seem to have been any more practical than Bright's system

9 - 13 Stenographic (John Willis, 1602).

Duthic finds Sonographic the best of the three, and considers it to be the foundation ot modern shorthand systems Figure

38 shows the twenry-six basic strokes, called "unchangeable particles . these were partly phonetic, and silent letters were

largely suppressed in writing words. A circle added to the foot of a stroke provided an h sound, and dots arranged in five

clockwise positions around the basic stroke stood for vowels. Abbreviated forms of words were built up by combining these

dementi in a manner somewhat like modern methods, Willis system is. in fact, very much like the later Pittman system

f which may well have been derived from ill, Duthie judges chat Stenographic could have been employed to record slow,

careful speech in condensed form, but not for rapid verbatim reporting. If is interesting to note that Willis called his system

Steganographie as well as Stenographic, and considered it appropriate for concealment of secrets.

In summary, it seems unlikely that any of these systems or others related to them are closely akin to the Vovmch script

The only clement among the Vovmch symbols that bears any resemblance to the dots, dashes, hooks, and tittles of the

carly shorthand methods is the hook or curlicue that appears frequently over the double-c'" character ^ w to turm

C^t There seems to be no visible structure of auxiliary marks added to a recurrent set of base symbols. It seems

considerably more reasonable, in mv opinion, to look for relationships between the Vovmch characters and medie\ull Latin

abbreviations, with some early numeral forms (see Section 4.1.2 and figures 16. 171-

9.2 Steganography: The Early History of Cryptology

There are records of ciphers in ancient Egypt and Rome: substitution ciphers of various kinds, some employing invented

alphabets or geometrical symbols, were known from the early Middle Ages. Roger Bacon was greativ interested in secret

writing, and much has been made {bv would-be decipherers of the Vovmch manuscript) of Bacon s

statements on this topic

m his Epuiola de Secret! s Openhus Artu et Naturae, He recommends, for the concealment of great and potent secrets, and to

prevent them from being abused by the common herd of mankind, the use of the following expedients; 1 } characters and

verses (or incantations I; 2) fables and enigmas; 3) leaving out certain letters, especially vowels (as the Hebrews.

Chaldeans, and Arabs do to make their secrets harder to readM; 4) mixing letters of different kinds (as, for example, the

astronomer Ethicus hid his knowledge by a mixture of Hebrew. Greek, and Latin letters i; 5* employing letters "strange to

one s own culture; 6 j creating characters from one s own imagination { this last being, according to Bacon, an especially

good method, used by Artephius in his Book of the Secrets of Nanire\\ 71 using geometric figures combined with dots and

signs instead of alphabetic characters: and finally 8) the "notory art." which Bacon thought was the best method of all: the

art of writing as briefly and rapidly as one desires. Bacon claimed to have used some, at least, of these methods in his ow n writings

This highly interesting and rather complete compendium of early cryptographic devices from the potent pen of the Doctor

Mirabiiis has understandably inspired many students of the Vovnich manuscript to seek some or all of these techniques in its

pages, and to see in it a result of Bacon's practice of his own recommendations. A considerable literature exists, dealing with

ciphers attributed to Bacon in alchemical works (Hime 1904. 1914, 1915: Steele 1928a. 1928b; Manly 1931). An

anagram, in which Bacon is supposed to have hidden a formula for gunpowder, is explicated variously by some, but

66

debunked by others fwho dismiss it as a- supers nous rale about a split willow branch that magicall* rejoins itselL or as a

careless misreading by an ear h editor of a sentence in a manuscript j.

A variety of cryptographic methods are described by other early writers, Ramon Lull (Yates I960, Rossi 1961 J.

Trithemius 1 1564, 1606), Porta (1563), Agnppa 1 1970), and Athanasius Kircher (Kircher 1631-McCracken 19-*S) are

all credited with systems which are essentially forms of ciphers and codes or could be used as such, John Dec was interested in

cryptography, and made use of it in his missions for his roval patron, Elizabeth of England, according to Deacon (1968*

Many early sysrems involved substitution ciphers, using inverted or distorted characters, geometric

figures, numerals,

alchemical and astrological symbols, Latin abbreviations, etc., in hybrid conglomerations. There were, in addition, some

more sophisticated techniques Lists of apparently innocent words all starting with a given letter could be used as alternate

codewords for that letter, so that an innocuous-appearing sentence consisting of five Latin words might conceal a five- letter

word that carried the true message. Correspondents each having a copy of the code book containing the long lists of cover

words i made-up words, names of angels and demons, stereotyped religious platitudes, etc.) could use them as an effective

means for concealing simple messages in letters isee. for example, Trithemius 1564, pp, 48ff.l, Ramon Lull's routine

geometric figures marked with letters could be employed to produce digraphs l Aa. Ab. Ac. . ♦. Az. fla, Bb. etcj which

could be made to stand for words or concepts, A number of early cryptographic systems employed cipher wheels with one

fixed and one rotating alphabet (e,g,. Alberti, m the late fifteenth century, and Silvester and Porta in the snereenrh. set

Silvester 1526. p 7: Porta 1563, pp ^3, 79. 83: and Meister 1902, 19061

Ant -cher ear It cryptographic device concealed a message within a much longer "dummy" text by some rule agreed upon

by the correspondents. Alchemy treatises, which were expected to be enigmatic even at best, were ideal vehicles for hiding a

brief message in this wav A related concealment system employed groups of rwo or three leners in various combinations, or

the presence or absence of some apparently decorative or accidental characteristic (small and large leners, onv dots,

underlines, or strokes added to some letters and not to others, shading, etc.). These groups could be made to stand tor letters

of a message by a variety of conventions: for example, in a triliteral system described by Trithemius (A.D. 1462-15 16 >

about 1500. a set of groups AAA, AAB, AAC ABA. ABB. ABC, . . ., CCA. CCB. CCC could provide twenry-seven values

for the letters of the alphabet and a few additional characters. The twenty- seven distinctions could be represented more

abstractly by any three states of three things, arranged m all unique combinations (three different fonts, levels of darkness in

printing, etc.). The famous cipher of Francis Bacon (about 1600) is of this type, differing from Trithemius system oniv in

that if used groups of five 'elements, made up of two distinctions or choices, and employed more sophisticated means or

concealing the distinctions m a cover text.

An impressive variety of cryptographic methods, exhibiting a surprising degree of compJextiv and sophistication, were m

use at an early date in the service of the Papal court and the courts of Italian Princes, A number of these systems art

described in Meister 11902. 1906). Pasini (1 87 3 K Sacco (1947). and Alberti 11568) Meister (1902) provides a detailed

history of early Italian ciphers, the earliest dating to 1 226 from the Venetian Republic and others from many Italian cities

during the fourteenth and the fifteenth centuries. Meister (1906) traces to the year 1326 or 1327 the earliest example of a

device called a 'nomenclator." consisting of a small list of code words or syllables standing for words and phrases com monk

employed in Church or State correspondence {"Pope \ '* horses'*, "soldiers' . stereotyped honorific phrases, place names,

titles, etc,]. Meister describes a number of remarkably complex and advanced systems in use for Papal correspondence d urine

the fourteenth and fifteenth centuries. These employed variant substitution elements! many alternative cipher elements all

standing for the same plaintext element), often drawn from fanciful, foreign, or invented alphabets Many such systems also

made use of "nulls' U list of alternative dummy symbols having no meaning in themselves but thrown in to pad out the text,

conceal patterns, and further confuse the would-be decipherer). All these devices could be employed in concert: a

nomenclator." really a primitive small code, plus an

elaborate system of monographic, di graphic, and trigraphic variants,

with a correspondingly varied set of nulls as well. Figure 39 shows a sampling of some early Italian cryptographic systems

Of particular interest because of its relatively early date is a system described by Jakob Silvester (1526). This system was

based on a Latin dictionary; a code consisting of Roman numerals was assigned to the columns of words on each page of the

dictionary. As an alternative, to further confuse the decipherer, a set of digraphs in random order f AF. DC. BN, etc, i could

be used instead of, or intermixed with, the Roman numerals to designate the column. Within each column, the individual

words, arranged in roughly alphabetical order, were indicated by Arabic numerals. Latin endings were shown by single

letters or digraphs The alphabet employed is made up of invented and foreign symbols of great variety. Nulls drawn from a

large set of choices could be scattered through the text. Figure 40 shows a sketch of the mam features of Silvester's system. -

and two short samples of text enciphered in it Unfortunately, Silvester s book does not provide enough detail regarding the

6T

dictionary or other aspects of the srstem to support a complete invest) canon of its relationship to the phenomena i»f the

Vovmch text, nor docs it provide any loop samples of enciphered text that might be studied statistically.

The reader who remembers the remarks of Tillman concerning the "beginning -middle -end" structure of words in the

Voynich text, and the comments of Tiltman and Friedman regarding universal and synthetic languages, will recognize the

possibilities of this early code system in accounting for the phenomena they had in mind I sec also Sections 5,6.5 and 6.6

above, as well as 9.) and the Appendix below l. Friedman and Tiltman made strenuous attempts to trace the history of

synthetic languages back to a dace sufficient! v early 10 be contemporary with the Vovmch manuscript ti*e,, before I 5A0> It

is my opinion that the earliest history of such languages can indeed be found by searching in two areas: first, among early

cryptographic systems, and second, in the medieval and Renaissance Ars Memoraeiva. Yates I 1966. p 378' mentions the

work of Francs Bacon. Comenms. Bmerfeid. Dalgarno. and Wilkins directed toward the development of a real character

u.e,, a system of signs like Chinese characters, supposed to be directly" related to their referents as are ideographs or

hieroglyphs, and independent of the spelling or sound of words). She traces this undertaking back to a foundation in an

ear her tradition of metnorv art. citing the work of Rosu (I960 1, A complex cryptographic system such as that of Jakob

Silvester could well form the basis of the Vovtuch text. It is interesting to note that a copy of Silvester s work in the British

Museum Library, dated 1616. is autographed by. and had presumably been in the possession of John Dee (Shulman I9"c

p 2),

9.3 Pasigraphy: Universal and Synthetic Languages

Ac che time during the late Middle Ages and early Renaissance when Latin was no longer functioning as a Lingua Franca

for learned internal communication and the vernacular languages were beginning to be employed more and more, mam

scholars began to be concerned about finding a substitute to fill the need for a universal language Ar the same time,

travellers, whether merchants or missionaries, were bringing news from the Far East of writing systems that appa tenth

employed ideographs and characters that could stand for ideas as wholes, rather than representing the sounds of words

through an alphabet. Thus there arose a number of efforts directed toward the development of a universal character or

real character' which would in some manner bypass the multiplicity of vernacular tongues and represent ideas di recti v in

the same wav for all nations.

This undertaking was not really a wholly new idea, in fact, it was solidly based in the encyclopedic mnemonic systems of

the Middle Ages Yates (1966» examines the work of Francis Bacon and others in the seventeenth century engaged m the

search for a universal language Leibnitz, as Yates shows, was a last great exponent of the ancient tradition, weaving the Art

of Memory into the creation of the infinitesimal calculus f Yates 1966. pp 378 ff.i.

The earlr synthetic languages had much in common with cryptographic codes As a foundation, a classification scheme

was set up for words or ideas to form a framework of what were called "svnearegoremata. "The word-classes were chosen b\

each author according to his own philosophical bent and purposes; while intended to be independent of any one language,

the scheme often involved numbers or codes assigned to the words of a Liun dictionary. Some of the categories are concrete

and straightforward, but many others seem forbiddingly abstruse and philosophical to the modern reader. In a system

devised b\ an anonymous Spanish Jesuit in 1653 called an "amhmetjcus nomenclator." a class was set up for all words

relating to the elements; this class was assigned Roman numeral l. Arabic numerals were used to select individual words

within the class, e.g., 1 Fire. 2. Flame, 3. Smoke 6. Wind. 7. Breeze. 12. Water, etc., f see Groves 1846. p 55

ff. i. Dalgarno s sysrem involved twenty classes of words or ideas, represented by capital letters: A. for example, stood for the

class "Ens. Res; H for Spmrus, U for Homo. 'etc. (Dalgarno. 1661 1.

John Wilkins, inventor of a system of real character " around the year 1 668. set up for tv classes including such things as

1 Transcendental. General 2. Transcendental. Mixed"; 5. God. the Creator"; 6 "The World. Creation , \sim

The Elements . etc These philosophical classes embodied the concepts about the nature of the universe current in those

rimes, and deriving from medieval foundations. Under each such class, subcategories were set up for differences and

species Differences were shown by vertical and oblique lines attached on the left of the basic symbol for the class,

species by an adjunct symbol attached on the right. Grammatical information lendings, etc. > was shown by dots or lines

attached to the compound symbol. Wilkins system had a spoken as well as a written form.

Groves 1 1846* and Kircher f 1663) provide summaries of a number of early synthetic language systems. Bausani 1 19 T 0i

ifives a very complete treatment of synthetic languages of all types, including religious, cryptographic, and mystical languages

as well Dalgarno s system is described m Dalgarno i 166 h. Comemus m GeissJer! 19591. Other

systems are presented in

Wilkins I 1641. 1668a, 1668b) and Top f 16031. These invented languages are of interest to students of the Vovmch

manuscript for several reasons- First, two dedicated and expen cryptologisis who devoted years of study to the

88

manuscript — Friedman and Tilrman — arrived independently at the hypothesis that a synthetic language of this rvpc mitne

underlie the Vovnich text. Second, the structure of the early universal languages \s base or root tor the class, followed b\ nnc

or more characters to single out the species or individual word, and finally characters standing tor grammatical forms

agrees very well with the "beginning- middle-ending struaure found by Tillman in the words of the Vovnich text. Finally

as we have seen in the previous section. the methods employed in some early codes used by the Papal Court were hiiihh

similar, and date to a ume sufficiently early to be contemporaneous with the origin of the manuscript.

9.4 Magical and Religious Languages and Alphabets

There remains for discussion another large group of synthetic languages which may have a bearing on the problem of tht

Voynich manuscript. Tndcr this heading I have lumped together a number of different secret or mystical languages or

various types: alchemical or philosophical systems; languages purporting to be revealed by. or used in communication with.

God, angels or demons: systems of symbols used in magical incantahons. prayers, and spells. Bausam 1 1970 1 provides an

excellent overview of all these made-up languages: including universal languages and the neologisms f "glowolalu" » ot

schizophrenics and other mentally disturbed persons or persons in temporarily abnormal mental states isuch as mystical

ecstasy or inspiration 1. Gessmann i 19 22) lists a large number of the words and symbols empluved by medie\u3 alchemists

physiaans. and astrologers.

94 - / Magical Languages.

We have already taken some glimpses of magical symbols and writing in the discussion of magical systems m Section S i

Most such systems included talismans, seals, diagrams, and devices \ daggers, swords, candlesticks, etcJ liberally decorated

with letters in a variety of bizarre alphabets. De Givrv (197 1) and Seligman (1948) prov ide copious illustrations of maeical

figures drawn from a wide range of sources and dates. Mans of the alphabets appear to be based on

Hebrew characters in

more or less garbled and distorted forms: Mathers (1974* pi. XV) shows several of these Hebrew writing systems

("Alphabet of the Magi/ Celestial Writing, ' "Malachim " or "Writing qf the Angels." and 'Passing of the River

Some symbob in Pkatrix are called "Indian," and may be distortions of Devanagari or some ocher Indian writing system.

Other Pkatnx characters are clear iv Arabic, and others still are similar to Egyptian Hieroglyphic or Hierauc characters

Egyptian words seem discernible in some of the incantations of the Hermetic writings tFestugiere L 94-1-54 j \ for txampie,

osergariach/' in a "true name of Hermes Tnsmegisrus" mav contain the words wjr ka re . strong is the Kj ot Re

Pkatrix also employs the "star picture writing made up of circles strung on

lines and curves mentioned earlier in Sections

3.3-3 and 8.4- It is interesting to note that two of the mystical Hebrew alphabets, the Writing of the Angels and Passinc

ot the River" also consist of small circles strung on lines m this fashion. Figure 4 1 shows some samples of magical alphabets

from various sources.

While interesting and suggestive, tew of the magical symbols discussed above seem to bear am direct resemblance to

anything in the Vovnich script or drawings, with perhaps one exception. The Puamx "star pictures, some of the Hebrew

alphabets, and certain alchemy symbols all are strikingly similar to the strange geometric figures decorated with faces in the

four corners of folio 67v2. It is also possible that the small design which Brumbaugh sees as a "dock face" may concur n the

character ", which is quite common in the Pkatnx spells and also in the other writing systems mentioned above

94.2 Alchemical * Medical, and Astrological Symbols.

Gessmann 1 1922) presents a large collection of the symbols and code words used by medieval alchemists and other

scholars and philosophers. Figure 42 shows a selection of these sufficient to indicate their general appearance and nature, anu

includes some that appear similar to certain Vovnich script characters. It was apparent! v a common practice for alchemists to

employ these symbols. interspersed in Latin text, as a son of secret shorthand for alchemical products and processes. W hilt a

few of these signs are somewhat similar to Vovnich symbols. most of them are not, and chev offer disappointingly little help

in our task. Of course, if a dear relationship were evident between alchemical symbols and the Vovnich script, alchemists ac

Rudolph s court would have had little trouble in deciphering it, and the mysten would not have persisted tu our day unsolved

The use of pravers and incantations in medical manuscripts is interesting in that many of the spells were in lamruagt-s

foreign to the compilers and users of the recipes; their verv foreignness increased the potency of their supposed. effect .

Another feature of these spells which may be relevant to our purpose is their repetitiveness; one. two. or three words are

often repeated several times in a row . either exactly or with minor differences, in a manner reminiscent of the repetitions in

69

nr* anv stretches of Vovnich text The oldest surviving Anglo-Saxon medical manuscripts exhibit numerous examples of these

practices (see Grattan and Singer 1912, Storms 1948). Some of the spells are distortions of Old Irish pravers brought in b*

Irish missionaries (e.g., "Gonomil orgomi) marbumil marbsai ramun. . . a spell against ' black blains. ' Grattan and

Singer 1952. p. 64). Some are garbled bits of Greek liturgy (e.g., Stomen cal cos. Stomen meta fotu." and 'Huiogomtn

patera eae vo cae agion pneuma. . Grattan and Singer 1952, pp. 49-50).

There are some interesting survivals in the Anglo-Saxon manuscripts of pagan Roman pravers. for example a beautiful

hvmn to the Earth Mother, ' Dea Sanaa Tellus. Rerum Naturae Parens , . . (Grattan and Smger 1952. pp. 45-46 i

Numerous relics of pre-Christian Anglo- Saxon religious rites and beliefs are discernible. Names of saints and apostles and

snatches of Biblical texts were employed as charms. Some spells combined garbled Greek. Hebrew, and Latin words m an

impressive -sounding conglomeration that must have had a strong psychological impact on the patient r'Ranmigan adonai

eltheos mur O ineffabiie Omiginan. . . sother sother miserere mci deus mini deus mi Amen AJleluiah, a spell for ' louse

bowels' . Grattan and Singer 1952, p. 189). Even the word Abracadabra." which has come down to modern times j\$ a

symbol for magical mum bo- jumbo, had a place in Anglo-Saxon medicine (the word "ABRACADABRA* was to be

written repeatedly on a parchment and applied to the patient Grattan and Singer 1952. p 10).

9 - 4-3 Mystical and Religious Languages,

St. Hildegarde ?f Bingen i A.D. 1048-1 179). whose visions have already been examined briefly for possible parallels cu

the Vovnich manuscript (see Section 3 2 3). was also gifted with the mystical ability of * speaking m tongues. Manuscripts

have been found preserving a series of "carmina (songs or hvmns) by Hildegarde in an ignota lingua *,

she apparent!*

sang or reared such compositions while under the sway of her mystic visions. An invented alphabet also formed a part of

Hildegarde's language: the letters are obviously distortions of Latin letters for the most part.

Bau&am (1970) provides a

number of examples of words from Hildegarde s language, preserved in a son of glossary written down by her

contemporaries. In many cases, associations with German and Latin are apparent, as is the use of inflections similar to Laan

endings. Figure 43 shows the alphabet and some samples of transliterated words.

Bausani (1970) mentions other, similar mystical languages employed by Elizabeth von SchOnau fa contemporary o f

Hildegarde. also m religious life, and a frequent correspondent with her), and Christiana von Trond The latter was in the

habit of uttering melodious and incomprehensible words from "between her chest and her throat " when in a state of

religious ecstasy. The mystical Sufi sea within Mohammedanism also developed a highly complex synthetic language called

Balaibalan." provided with an extensive set of grammatical and syntanical rules and a large lexicon. Bausam £ 1970) gives

some examples of this language. The possibility cannot be ruled out that a made-up language of this type underlies the

Voynich script, devised by an exceptional individual under the power of religious inspiration.

9 - 4-4 The Enochs an Language of John Dee.

Deacon (1968) presents a dear and detailed description of the secret language which Dee and Kelley claimed to have

received as a revelation from the angels through the 'scrying glass." He also provides a highly interesting discussion of the

angelic conversations'* carried out by Dee and Kelley during the early 1580 s (Deacon 1968, pp. 138-156) Casaubon

(1659) describes these conversations in great detail, in a work based on Dee's diaries and manuscripts, previously transcribed

by Elias Ash mole. The following account is drawn from these two sources. I strongly urge any interested reader to obtain

access to Casaubon s work and read it in hill (there is a copy in the Fabyan Collection, Library of Congress). It is a fascinating

and remarkable account, and the present brief summary can by no means do si justice.

As we have seen above (Sections 8,4.4 and 8.9), John Dee was never able to p er c eive ihe visions in his crystal or hear the

angels voices. For these offices he relied entirely on Kelley, who was evidently a highly unstable and unscrupulous

personality. How much of what went on in ihe amazing seances reported in the diaries was invented by Kelley in order to

make himself indispensible to Dee or to gain a decisive influence over him, is a matter open to question. Deacons view is that

Dee was using Kelley rather than the other way around, and that both were engaged in cryptographic and espionage missions

for the English Crown under cover of Dee's astrological and demonological activities. In any case, the manner in which the

spirit communications were received and recorded seems so complex and demanding as to be almost unbelievable. Kelley

evidently often became impatient with the effort involved, and Dee had to plead with him and importune him to get him to

continue: one gains the impression that Kelley was never nearly as interested in the angelic communications as was Dee. and

would much have preferred to focus his energies on the making of gold.

70

\

Dunne (he seances • mam of which took place during a visit w the court u f the Polish Count Lasks in Cracow and at

Rudolph's court m Prague/, Kellev sat before rhe crystal and reported what he saw and heard to Dee. who wrote it down,

occasionally putting questions to the spirits through Kellev Kellev often saw rhe angels themselves, and other persons and

beings as well, often moving through elaborate scenes and anions as on a stage (walking along a road, climbing mountains,

crossing streams, ere h He describes rheir faces, gestures, manner, dothing. and acn vines m remarkably vivid detail.

Casaubon s account provides extensive information concerning the setting, preparations, apparatus, and method of operation

during these sessions, as well as a verbatim account of the visions rhemseives From p. 75 on, he reports the communication

of a sei of cipher matrices or 'tables to Dee and Kellev by the angels. Kellev saw the matrix in the crysral with an angel

standing nearby, pointing to its squares with a wand; Kellev then read them off to Dee. who made a copy of the matrix tor

their own later use Mam such "tables' were transmitted by the angels, the set called the "Book of Enoch, for example

comprised fort v- nine tables, each having fern-nine rows and for tv -nine columns Ultimately at least twenty -six complete

books of tables and rext were dictated to Dee and Kellev by the spirits.

Along with the tables, the angels dinned long lists of vocabulary words, each list followed by a passage of running text

that used the words, much like an every-day elementary language lesson During this process. Dee often asked some

penetrating questions concerning affixes, structure, similarities he noted between words or pans of words, etc., he also asked

for and obtained repetitions of things he had not heard right or questioned for some reason. Casa u bon gives page after page

recounting this a marine linguistic research, for all the world like a series cl sessions between a field linguist and his name informants.

Deacon (1968) provides the following description of the

wav running texr was dictated "Each of the cables which Kdle\

had in front of him consisted of a large square subdivided into forty-nine by forty-nine small squares, each containing a letter

ol the Enochian alphabet These letters were in apparently random order. Kellev would look mio the ervstai and see the

angel pointing to one these small squares tn a replica of the table in the crystal and would call our—say 4 D .as in map

reading) Dee would find the square in his table and write down the relevant letter. . . The result was a sentence in

Enochian written backwards. It is almost impossible to believe that this could be faked, especially when one remembers that

there were nifiety -eight tables to choose from for memorizing, if one was faking it." (pp 1 50- 151) In Casa u bon s account,

individual words are clearly shown written backwards I with the Last letter first), and the order of words m each sentence or

paragraph sem as a unit is also backwards, so that the last word sent is the first word of the passage as it is to be read Figures

43, 44, and 45 show the alphabet and some examples of Enochian text; lit may be noted that certain letters that appear in

the text are not represented in the alphabet, a fact which is nowhere explained in the sources)

Enochian. according to Deacon, is unique and different from any other Cabalistic language or magical system, so tt is hard

to see how it could have been plagiarized from any other secret writings. Robert Hooke, a prominent seventeenth -century

scientist and a member of the Roval Society held the view that Enochian was essentially a cryptographic and espionage

device, like a code. Deacon claims that Enochian is a bona fide language, and can be learned with some difficulty from Dee s

unpublished manuscripts le.g.. Libn Mystertorum, Sloane ms. 3188, British Museum!, and from Casaubon s book i 165SM

The Rosicrucian Order of the Golden Dawn (England. L875) adopted Enochian and employed it in their ntes. The reader

may verify for himself in the samples shown in figures 44 and 45 that words having a constant meaning are repeated with or

w.thom additions. 'OD'\ and ; THIS". "are", and ICHISGET arc nor": 'TAl'SGf AT. the earth , CHRISTGOS . let there be . etc. Whatever its relevance to the Vovrnch manuscript, this amazing account of research in

field linguistics among the denizens of the spirit world deserves a careful study by modern psycholinguists and historians

Chapter 10

Collateral Research: Early Herbals and Materia Medica

The history of herbals, botany, and materia medica is a major area of study which no student of the Vovmth manuscript

can afford to ignore. As we have seen in Sections 3 3 1 and 3-3-2 above, many researchers have made vigorous attempts w

link the herbal and pharmaceutical drawings to those in orher medieval and Renaissance medical works, with little success. A

number of good general works on early herbals are available to the student: Arber f 19531. Rohde! 1922 i. and Sinicer

(1927) cover the history of early herbals in general, with a strong emphasis on Old English herbals; Siedermann ■ 12

provides a large collection of beautiful illustrations of early botanical, magical, and medical drawings as well as j general

treatment of these topics. Cockayne (1866) and Grattan (1932) cover the Anglo-Saxon herbals ver\ completely, and -dsn

trace their history and sources. Excellent treatments of the history of medicine may be found in Singer i 1928, 1 c >62 h Taylor

(1922). and Thorndike (-1963L while Thorndike J 1923-38) provides extensive detail on the work of individual physicians

among other scientists Tiltman (1968, pp. 1 1-13 1 gives a brief bur very useful sketch of the early history of herbals and

botanical illustration in relation to the study of the Voynich manuscript. The following survey, drawn from these sources,

while high I v abbreviated, may serve to introduce the reader to the subject and its literature

The eiriesc beginnings of botanical drawing and description are to be found in Greece, as is true ut so much of Wester n

learning and philosophy. Aristotle was said to have written a treatise on plants: this work was apparently Lost at a relative!*

early date, and was not among the works of Greek learning preserved by the Mohammedans and transmitted to mediewl

scholars through them Aristorle's pupil Theophrastus of Eresus. however, produced a work which served as 4 source for the

Greek "rhizotomiscs* ("root -diggers'*, frequently ignorant and superstitious gatherers of medicinal plants who were the

pharmacists, physicians, and medical suppliers of their davh In the first century B.C. a highly talented and unusually

learned member of this class of rhizotomists named Craieuas compiled an herbal containing the first known set of plant

drawings. Crateuaj (132-63 B.C) was physician to Mithridaces VI Eupator, King of Pontus in Asia Minor. His herbal was

illustrated with pictures apparently drawn with great care and arttstry from life, each accompanied by a brief description of

the medicinal effects and uses of the plant.

While no manuscripts of Crateuas' work have survived, a revision or extract of it has been preserved, with some that the

original drawings, in the Materia Medica Lrbri Qutnque of Dioscondes Anazarbeus. a physician attached to the Roman

Army in Asia during the first century A D. (Dioscorides 1939* Dioscondes' text and mans of the drawings were

reproduced in a beautiful manuscript herbal presented in AD 312 to Juliana Amcia. daughter of a Roman Emperor, rhii

manuscript, called the Juliana Amcia Codex, is preserved in Vienna, and a part of a facsimile may be seen, according to

Tiltman '1968k in the Garden Library of Dumbarton Oaks. Biedermann 119721 and Singer (1927. 1928) provide j

number of illustrations of these exquisite drawings, whose lifelike and artistic quality are judged by experts to far exceed that

of many. if not most, subsequent herbals well into the Middle Ages. In spite of its early date, the Juliana Amcia Codex ihus

constitutes a major high point in the history of early herbals. reached by few others tor many centuries thereafter.

The first known herbal in which plants were described to alphabetical order was that of Pamphiluis. compiled around

A.D 100, Many early herbals also empioved an alternative arrangement dealing with plants tn an order dictated by the boey

part to which their medicinal effects pertained, usually starting at the head and finishing at the feet. Piinv the Eider, in his

Saturalis Histone (A.D 771 compiled a massive enevdopedia comprising thirty -seven books covering all the natural sciences

of the dav. This collection of magical and superstitious beliefs. Old Wives' tales, myths, and observations concerning birds,

beasts, plants, medicines, metals, minerals, and a hosr of orher topics was greatly influential in the Middle Ages. An herbal

based on Dioscondcs' long-lived work was compiled by Apuleius (or 'Pseudo -Apuleuis , as he is frequently called to

distinguish him from the author of The Golden Ass\ about A.D. 400. This work. The Herbarium of Apuleius PUsonicus

became one of the most widely known and copied of the early herbals; it survived m some form into che late Middle Acts

and Renaissance, and was among the first illustrated printed herbals.

Aside from the above-mentioned "" high -spots * and a few ocher influential works, there was little original research on

plants, and almost no attempt to study or draw plant life from nature, or to make any objective, empirical trial of medicinal

effects atter the fashion of the modern scientist. The Greek herbals and their Latin translations were copied over and over

again, their drawings becoming more and more debased and distorted in the process. The names of the plants, and the species

originally illustrated, were of course those of the Mediterranean region or of Asia Minor: ancient and medieval herbalists

seem never to have realized or understood that very different plants grew in different places. The names, often drawn from

73

dead or moribund ancient languages, and couched in ancient forms chat were no longer understood, were carefully copied along with the drawings.

The monks in English and Continental monasteries did the best rhev could to match the garbled pictures of foreign plants

and their exotic names against the flora of their own monastery gardens and countryside * As a result of rheir efforts, lone hsu

of synonyms for plant names in various languages were compiled and attached to the herbals ro serve as glossaries. One

cannot help wondering how many hapless patients lost their lives through the inevitable m i side nri fi cation of poisonous plants

as medicinal species. Singer { 1928, p. 1 85 1 sums up the state of affairs in his discussion of the Herbarium of Apuleius: u trh

the impatient hindsight of the modern scientist, he points to it as an instance of over a thousand vears of slavish copvinc

applied to 'a futile work with its unrecognizable figures and its incomprehensible vocabulary

The Latin and vernacular herbal* of the West were thus, for the most part, simply translations or compilations of the

Greek works, A Latin translation of Dioscor ides' herbal became the basis for many later medieval herbal*. The Old English

her bah have been intensively studied by scholars, and are of particular interest because of the many primitive pagan survivals

thev preserve, in more or less superficially Christianized form. The Leech Book of Bald (Roval 1 2D. British Museum). is

one of the earliest and most interesting of the Old English herbal*, dating from the tenth century, it presents many examples

of pagan magical spells and practices. Another early herbal preserving pagan survivals is The Lacnunga, also dating from the

tenth

century (Harleian 585, British Museum). A Saxon translation of the Herbarium of Apuleius extant in many copies,

and another Saxor translation of a work of the Salernitan medical tradition in Italv. called Pen Drdaxeon. both dating from

the eleventh cent; rv, were also highly influential among early English herbals; see Grattan and Singer I 195 2), Cockavne

i 1866). and Storms (1948). and see also the brief discussion in Section 9.4.2 of pagan charms from the earliest herbals.

Singer 1 1 928) traces the history of botanical illustration tn some detail. During the Middle Ages, a relatively small

number of schools or traditions of plant illustration came into existence. Most of the drawings were highly stylized and

diagrammatic, produced with little or no rhoughr of observing nature at first hand or even of revising details tram personal

knowledge which must often have contradicted what the compiler saw in the sources he was copying A few notable

exceptions provide some relief from the stereotyped rigidity of most plant drawings in medieval herbals. A Latin manuscript

from Bury St. Edmunds in the twelfth century included some naturalistic drawings among a majority of traditional copies.

The compiler apparently did his best to identify the ancient and garbled figures of foreign plants in his sources with the

plants in his garden; where he succeeded, he attached the local plant name to a copied drawing. Where he could find no

match for an English plant among the drawings, he made a new one to fill the gap. The stylization of plant draw ings reached

an extreme in the thirteenth century, according to Singer, when they deteriorated into geometrical forms rigidly enclosed

within a gold frame. Albertus Magnus tA.D. 1206-1 280') included in his encyclopedic works a section called "On Plants'

compiled from a Pseudo -Aristotelian work, and Albertus is credited with some first-hand observation of the natural objects

with which he dealt.

In preparing herbal as well as other manuscripts, it was the practice of the medieval sen be or copyist to leave a space in the

text of each paragraph for a drawing, usually of a shape and lize matching the corresponding picture in the source he was

copying. The illuminator then supplied the pictures, if the patron or owner of the manuscript had the money to afford them.

Singer ascribes a major advantage" (from our modern point of view) to the illuminator over the scribe, in that the former

was relatively unlearned, and thus freer from the stifling rigidities of tradition binding the scribe to the past. For this reason.

Singer judges the figures in some medieval herbal* to be in advance of the text in naturalism and accuracy, and sees m them a

fresher and livelier spirit. The illuminators made some attempt to show local plants rather than copying the meaningless

exotic originals in the ancient sources. In some cases, the holes left by the scribe were never filled (presumably because the

owner ran out of money before he could hire the services of an illuminator): sometimes they were filled much later with

pictures of a different size or shape that did not fit into the spaces very well. It is interesting to contrast this common medieval

practice, whereby a scribe left spaces to be filled later and separately by an illuminator, with the integral composition t>!

drawings and text in the Voynich manuscript.

After the low point reached during the thirteenth century, herbal illustration increased in naturalism and beauty

throughout the fourteenth and fifteenth centuries tar least as fudged by the modern observer). Some late medieval herbals

are remarkable for the life-like and artistic qualm of rheir illustrations; reproduced by Singer 119281 are several examples in

which insects (a dragonfly, beetles, caterpillar*, etc.) are shown sitting on the plants, all represented in a sivle almost

indistinguishable to the casual eve from a good modern drawing. Among the better illustrations are the beautiful woodcuts

(made by Hans Weidm) in Otto BrunfeLs Herbarium Vi vat Esc one j. compiled in 1530. The text, unfortunately, is far

below the standard set by the pictures: copied from the durable herbal of Dioscorides. it describes mediterranean plants

completely inconsistent with the local plants to the drawings, from the Rhine region in Germany. A widely copied work

74

produced in 1542 by Leonhard Fuchs fA.D 1501-1 566* called De Histona Stirptum presents a set of relatively accurate

plane identifications and an outstanding senes of woodcuts by Albrecht Mever based on a study of nature The first tr uK

modern herbal is judged by Singer to be that of William Turner in 155 1: it is described as the first scientific work on plants

in our modern sense. Rembert Dodocns of Holland also produced a fine herbal in 1554; the famous Herball of John Gerard

(1633) was based on Dodoens work, but employed for i u illustrations a magnificent set of 1300 woodcuts made in Europe in 1590.

As Tiltman and other students of the Vovmch manuscript have noted, they have had little success in relating its plant

drawings to anv of the limited traditions of plant illustration touched upon above, or indeed to anv other herbal drawing or

manuscript. There is a very general similarity of feeling or design in some Vovmch manuscript drawings and a scatter: m: or

pictures in this herbal or chat one. There is also a superficial similariv of stvie between some Vovmch manuscript drawings

and some of the very debased, distorted products of successive recopving in early herbab (although the stviization of the

Voynich manuscript plants may well be deliberate rather than a result of degradation through copvmg; we have in any case

been notably unsuccessful in discovering any source from which such .copies might have come). There is nothing in these

comparisons to convince any student that he has found a counterpart or original for a Vovmch

manuscript drawing m anv

other herbal manuscript. There is always a possibility; of course, that some manuscript or early printed work with drawings

close! v akin to those in the Vovnkh manuscript mav yet be turned up by some diligent researcher. The alchemical drawings

shown in figure 36 seem, at least to my eye, considerably closer in stvie and feeling to the plant drawings of the Vovmch

manuscript than most, if not all. of the herbal illustrations I have seen in mv own admittedly limited search for parallels It is

my feeling that we should certainly include alchemy works in our investigations, ever chough they might not be expected to

deal with plants as such, but rather as symbols for alchemical entities (the sun, moon, metals, chemicals, etc.)

75

Chapter 1 1

Concluding Remarks: Some Suggestions for Further Research

In dosing this monograph on the Vovnich manuscript. I would like to suggest some lines along which future work on the

problem might profitable- be directed. These suggestions include efforts aimed at gathering more data to resolve some of rht

many unknowns m the problem; and efforts designed to achieve a more rigorous, complete, and scientific analysis of (he data

we now have.

1 LI Paleographic and Other Scientific Studies of the Manuscript

in mv opinion, it is of primary importance that the inks, pigments, and vellum of the manuscript be tested and examined

scientifically and compared to Those of other manuscripts by paleographers and art historians: and chat the pages of the

manuscript be studied under special lighting and otherwise treated to bring up traces of erased, faded, or illegible writing As

far as 1 have been able to discover, no such research has ever been carried out. Further, there are no current plans on the part

of the present owner of the manuscript (the Seine eke Library at Yale> to make anv such studies in the near tutor*

Nevertheless, only studies such as these can offer any hope of satisfactory answers to many of our questions. They could turn

up crucial new information that might completely alter the complexion of the problem I hope that some present or future

studenr will be able to arouse interest in a scientific physical study of the manuscript, obtain funding for it. and set the

necessary wheels in motion to accomplish the research and make its results known to other students. If

any reader of this

monograph knows of any such scientific studies already carried out on the manuscript, 1 hope he will inform me ot them

1 1.2 Uncovering More of the Manu script's History

As we saw m Chapters 1 and 2. Wilfrid M. Vovnich succeeded in ferreting out a considerable quantity of useful and

interesting information about the history and previous ownership of the manuscript. In his hisroncal sketch I Vovnich 1921 k

he indicated many promising leads for others to pursue. Every known or suspected owner of the manuscript should be

researched in depth; renewed attempts should be made to locate correspondence, libraries, and other collections ot papers

pertaining to or belonging to these people, and to track down any references to the manuscript and attempts to decipher it.

Someone should certainly try to locate the Villa Mondragone or other places where papers and manuscripts once stored there

might now be preserved, in the hope of finding additional records relating to the manuscript lior example, notes made b\

Athanasius Kircher or by the unknown previous owner who wrote co Kircher about the manuscript). The archives of

Rudolph's Court at Prague should also be a promising source of correspondence or notes concermne the manuscript

Background sleuthing of this nature is certain to provide us with at least a few new 1 nugget of information that could

transform the problem or. at least, reduce the discouraging number of unknowns that now confront us

1 L3 Collateral Research

While

all the most obvious sources have apparently been examined, as well as some more obscure ones, m search or

possible parallels to the Voynich ten and drawings, it still seems worthwhile to keep up the hum among less well-known and

less accessible sources. I believe that alchemy writings, in particular. deserve closer attention, since they may not have been so

thoroughly studied by Vovnich manuscript researchers as have herbal, medical, and astrological sources. More attention co

early cryptographic writings of the fourteenth through the sixteenth centuries might also rich I v repay our efforts In fac: a

determined, thorough, and painstaking attempt to search through manuscript collections and early printed books on almost

anv of the topics iketched in Chapters 8 and 9 of this monograph could still turn up a new and illuminating bn of evidence

for a student specifically searching for a parallel to the Vovnich manuscript It seems to me highly unlikely that the Vovnich

manuscript scribe! j) and illuminator! s) never wrote or drew any other work in their lives; there is always a hope of finding

somewhere a drawing of similar style that might give us a due to their identity or place of origin, or another scrap ot text in

the Vovnich script among someone s papers,

1 1.4 A Comprehensive Machine File of the Text

in Chapter b, we saw that several abortive attempts were made to carry our computer studies of the enure corpus

Vovruch teat. Out of the approximately 250.000 characters of text in the manuscript, most students have studied onh small

samples ranging from 5000 to 25.000 characters in length. Cumcr has probably dealt with the largest machine samples of

any student, and his transcription alphabet appears to be the most practical choice for machine processing. U have discarded

mv own transcription in favor of Currier's, in spite of the fact that I had already placed some 19.000 characters of text on

magnetic tape using mv own alphabet before 1 came upon detailed descriptions of his research.! Father Petersens

concordance of the entire manuscript, made by hand, is preserved in the Friedman Collection at the Marshall Library in

Lexington. Virginia, where tt is not easily accessible to most students.

It would be of great value, in mv opinion, to have a complete machine file of the corpus, in Curner s transcription, and

including identification of "hand." ' language/ and the apparent subject matter f herbal, pharmaceutical, astrological, etc \blacksquare

as well as any other property which students have found to be statistically significant. This file could be used as a basis lor a

wide variety of studies, to help in forming and testing hypotheses concerning the text, and exploring further the important

' hand' and "language phenomena discovered by Currier as well as other matters. Smaller, carefully selected samples could

be formed from the entire corpus for any specific purpose.

1 1.5 Scientific Hypothesis Formation and Testing

Hypotheses about the nature of the text should be based on all the known phenomena, and on a careful srudy of the entire

corpus ol text inor just one section or a few pages here and there l . The hypotheses should also take mto account and attempt

to explain all the phenomena clearh demonstrated by other researchers (Tillman's "beginning -middle -ending structure.

Curner's languages" and "hands *; the repetitive patterning of 'words/' etc.). Finally, the hypotheses should be consistent

with, and bear some relation to. what is known of the nature, background, and history of the manuscript itself In addition. I

think we should entertain not just one hypothesis, but a set of alternative theories that seem capable of explaining all or i

large part of the data. Having set up such a body of reasonable hypotheses, we should design "experiments" based on

samples selectively drawn from the entire corpus (all made accessible to computer processing in one format and transcription,

as suggested above): samples such that we can attempt to confirm or discern firm each of our theories in an orderly manner

This research will, of necessity, also involve parallel studies of text in Laun. in certain other natural languages, or m synthetic

languages of various types

In the absence of any cribs, parallel texts, or other breaks into the text via external or collateral data, our onh hope of

success lies in an orderly and cooperative scientific approach to the entire body of text and all the other data we have. In this

way, perhaps we can some day achieve a solution whose satisfying completeness and appropriateness will do full justice to the

elegant enigma of the Voynich manuscript.

78

"THE MOST MYSTERIOUS MANUSCRIPT IN THE WORLD"

THE ROGER BACON CIPHER MANUSCRIPT

(BACON, ROGER ?.) Cipher manuscript on vellum. Text written in a secret script, apparently based on Roman minuscule characters, irregularly disposed on the pages. 102 leaves (of 116; lacks 14 leaves), including 7 double-folio folding leaves; 5 triple fc iio folding leaves; and one quadruple folio folding leaf. With added signature marks (of the XVth or XVIth century), and foliation (of the XVTth or XVIIth century) 1-11, 15-58, 65-75, 75-90, 95-96, 99-108, 111-116. With about 400 drawings of botanical subjects, including many of full-page size; 55 drawings of astrological or astronomical subjects, plus about 550 single star-figures; and 42 (biological?) drawings, most of which include human figures. The drawings colored in several shades of green, brown, light yellow, blue, and dark red. Large 8vo (c.250 x c. 160 mm.). Old limp vellum covers (now detached). From the libraries of John Dee (?), the Emperor Rudolph II (reigned 1576-1611); Jacobus Horcicky (Sinapius) de Tepenecz; Joannes Marcus Marci of Cronland (1666); Athanasius Kircher, S. J.; and Wilfrid M. Voynich. Accompanied by an Autograph Letter signed by Joannes Marcus, presenting the book to Athanasius Kircher.

No place or date, (XVth century, or earlier?).

An enigmatic mediaeval manuscript, which for over forty years has baffled the scholars and cryptographers who have attempted to wrest its secrets from it. It has been termed by Professor John M. Manly, who made a detailed study of it, "the most mysterious manuscript in the world."

This book, bequeathed to me by in intimate friend. 1 destined for vQu. mv verv dear Athanasius, as soon as it came into mv poscssion. for J was convinced it could be read by no one except yourself.

The former owner of this book once asked vour opinion by letter, copying and sending vou a pomonof the book from which he believ ed vou would be able to read the remainder, but he at that time refused to sendThe book itself. To its deciphering he devoted unflagging toil as is apparent from attempts of hts which I send vou herewith, and he relinquished hope only with his life. But his toil was in vain, for such Sphinxes as these obev no one but their master, Kircher Accept now this token, such as it is and long overdue though it be. of my affection for vou. and burst through its bars, if there are any. with vour wonted success.

Dr. Raphael, tutor in the Bohemian language to Ferdinand III. then King of Bohemia, told me the said book bad belonged to the Emperor Rudolph and that he presented the bearer who brought him the book 600 ducats. He believed the author was Roger Bacon, the Englishman. On this point 1 suspend judgement; it is your place ro define for us what'view we should take thereon, to whose favor and kindness I unreservedly commit myself and remain

At the command of your Reverence.

123	
Bibliography	
[f] has been suggested to mt by a udkague that 1 should add a note to this bibliography tdling where t	th
hot!k> nu*\ K	.11
found. Most of the books may be obtained either from the Library of Congress i including the Rare Book Room'. Widener	

Library at Harvard I'niversity. or the Main Library at Catholic University. Some are recent reprints which I saw in the Yes

Bookstore in Washington. D,C The purpose of this bibliography is to make the literature as accessible as possible to am

serums student of the Voviueh manuscript; hence 1 have provided information on currently available reprints and fac-

simile editions of some older works. Personal communications and other unpublished materials are

preserved in a collection

of Vovmchiana, and may be examined by arrangement with me.J
